List of series on air transport suggested by J. Parker Van Zandt, The Brookings Institution, and by Civil Aeronautics Administration, Department of Commerce. Data supplied by Civil Aeronautics Administration.

Chapter R. Communications

Historical Statistics . . . Colonial Times to 1970

Consultant—Hyman H. Goldin, Boston University

Historical Statistics . . . Colonial Times to 1957

Principal consultants—Hyman H. Goldin and Robert E. Stromberg, Federal Communications Commission

Review consultant—Melville J. Ulmer, American University

Chapter S. Energy

Historical Statistics . . . Colonial Times to 1970

Consultants—Joel Darmstadter and Sam H. Schurr, Resources for the Future, Inc.

Major contributors—Charles L. Franklin, Federal Power Commission; Paul J. Rederer, Edison Electric Institute; John W. Eden, American Gas Association

Historical Statistics . . . Colonial Times to 1957

Principal consultant—Lawrence D. Jennings, Federal Power Commission Review consultant—Herbert B. Dorau, New York University

Historical Statistics . . . 1789–1945

Basic text and series on power supplied by Division of Finance and Statistics, Bureau of Accounts, Finance, and Rates, Federal Power Commission.

Chapter T. Distribution and Services

Historical Statistics . . . Colonial Times to 1970

Consultants—Louis Greenberg, Bureau of the Census, and David Schwartzman, New School for Social Research

Historical Statistics . . . Colonial Times to 1957

Principal consultants—Reavis Cox and Charles S. Goodman, University of Pennsylvania

Review consultant—Harold Barger, Columbia University

* See also Appendix, p. A–1.

Chapter U. International Transactions and Foreign Commerce

Historical Statistics . . . Colonial Times to 1970

Consultant—Robert E. Baldwin, University of Wisconsin
Major contributor—Frances L. Hall, Bureau of International Commerce

Historical Statistics . . . Colonial Times to 1957

FOREIGN TRADE

Principal consultant—Herbert B. Woolley, New York University
Review consultant—Douglass C. North, University of Washington

BALANCE OF INTERNATIONAL PAYMENTS AND INVESTMENT POSITION

Principal consultant—Nancy F. Culbertson, Office of Business Economics
Review consultant—Walter S. Salant, The Brookings Institution
Other contributors—Douglass C. North, University of Washington; Matthew Simon, Pace College

Historical Statistics . . . 1789–1945

Basic text and series for balance of payments supplied by International Economics Division, Bureau of Foreign and Domestic Commerce, Department of Commerce.
Material on foreign trade prepared by Bureau of the Census staff.

Chapter V. Business Enterprise

Historical Statistics . . . Colonial Times to 1970

Consultants—Martin Gainsbrugh and Bernard Gelb, The Conference Board, Inc.
Major contributors—Lloyd K. Gilmour, Internal Revenue Service; Ralph L. Nelson, Queens College

Historical Statistics . . . Colonial Times to 1957

BUSINESS POPULATION

Principal consultant—Morris A. Adelman, Massachusetts Institute of Technology
Review consultant—Irwin Friend, University of Pennsylvania

CORPORATE ASSETS, LIABILITIES, AND INCOME

Principal consultant—Sergei P. Dobrovolsky, Rensselaer Polytechnic Institute
Review consultant—Irwin Friend, University of Pennsylvania

Chapter W. Productivity and Technological Development

Historical Statistics . . . Colonial Times to 1970

PRODUCTIVITY INDEXES

Consultants—Jerome A. Mark, Bureau of Labor Statistics; John W. Kendrick, George Washington University
Major contributors—Charles W. Ardolini, Bureau of Labor Statistics; Daniel Creamer, The Conference Board, Inc.

COPYRIGHTS, PATENTS, AND TRADEMARKS

Consultant—Fritz Machlup, Princeton University

RESEARCH AND DEVELOPMENT

Consultant—Daniel J. Kevles, California Institute of Technology
Major contributor—Thomas J. Mills, National Science Foundation

Historical Statistics . . . Colonial Times to 1957

PRODUCTIVITY INDEXES

Principal consultant—Leon Greenberg, Bureau of Labor Statistics
Review consultant—John W. Kendrick, George Washington University
Other contributors—Robert T. Adams and Julian Frechtman, Bureau of Labor Statistics

COPYRIGHTS, PATENTS, AND TRADEMARKS

Principal consultant—Jacob Schmookler, University of Minnesota
Review consultant—Fritz Machlup, The Johns Hopkins University
Other contributor—P. J. Federico, Patent Office

RESEARCH AND DEVELOPMENT

Principal consultant—Kathryn S. Arnow, National Science Foundation
Review consultant—Irving H. Siegel, Council of Economic Advisers

Chapter X. Financial Markets and Institutions

Historical Statistics . . . Colonial Times to 1970

FLOW OF FUNDS; NET PUBLIC AND PRIVATE DEBT; MONEY SUPPLY AND GOLD; INTEREST RATES AND SECURITY MARKETS; BANKING; NONBANK FINANCIAL INSTITUTIONS

Consultant—Stephen P. Taylor, Board of Governors of the Federal Reserve System
Major contributor—Anna J. Schwartz, National Bureau of Economic Research, Inc.

INSURANCE

Consultant—C. Arthur Williams, Jr., University of Minnesota

Historical Statistics . . . Colonial Times to 1957

BANKING; MONEY SUPPLY AND GOLD; MONEY RATES AND SECURITY MARKETS; CREDIT AND OTHER FINANCE

Principal consultants—Susan S. Burr and Caroline H. Cagle, Board of Governors of the Federal Reserve System
Review consultant—Milton Friedman, The University of Chicago
Other contributor—Clark Warburton, Federal Deposit Insurance Corporation

PRIVATE INSURANCE

Principal consultant—Albert I. Hermalin, Institute of Life Insurance
Review consultant—James J. O'Leary, Life Insurance Association of America

Historical Statistics . . . 1789–1945

Data reviewed and basic text supplied by Division of Research and Statistics, Board of Governors of the Federal Reserve System.

Chapter Y. Government

Historical Statistics . . . Colonial Times to 1970

ELECTIONS AND POLITICS

Consultant—Richard M. Scammon, Elections Research Center
Major contributor—Walter Dean Burnham, Massachusetts Institute of Technology

GOVERNMENT EMPLOYMENT AND FINANCES

Consultant—Murray L. Weidenbaum, Washington University
Major contributors—Thomas J. Cuny and Carey P. Modlin, Office of Management and Budget; M. Lynden Mannen, Governments Division, Bureau of the Census

ARMED FORCES AND VETERANS

Consultant—James L. Clayton, University of Utah
Major contributor—Howard J. Sharon, Veterans Administration

Historical Statistics . . . Colonial Times to 1957

ELECTIONS AND POLITICS

Principal consultant—Richard M. Scammon, Governmental Affairs Institute
Review consultant—V. O. Key, Harvard University

GOVERNMENT EMPLOYMENT AND FINANCES

Principal consultants—Jacob M. Jaffe, Bureau of the Census; James M. Jarrett, Internal Revenue Service; I. M. Labovitz, Library of Congress; and Flora M. Nicholson, Civil Service Commission

Review consultant—I. M. Labovitz, Library of Congress

Other contributors—Paul B. Trescott, Kenyon College; Paul P. Van Riper, Cornell University

ARMED FORCES AND VETERANS

Principal consultants—Milton C. Forster, Veterans Administration; Michael S. March, Bureau of the Budget

Review consultant—Irving H. Siegel, Council of Economic Advisers

Other contributor—Sydney M. Ratcliffe, Department of the Army

Historical Statistics . . . 1789–1945

Series and basic text on elections and State and local finance and employment were supplied by the Governments Division of the Bureau of the Census.

Data on Federal Government finance were prepared in the Bureau of the Census with the cooperation of the Office of the Technical Staff, Treasury Department.

Series and basic text on copyrights, patents, and trade-marks were supplied by P. J. Federico, Examiner-in-Chief, Patent Office, Department of Commerce.

Chapter Z. Colonial and Pre-Federal Statistics

Historical Statistics . . . Colonial Times to 1970

Consultants—Lawrence A. Harper, University of California; Robert C. Klove, Bureau of the Census

Major contributors—Jacob M. Price, University of Michigan; Stella H. Sutherland, Due West, South Carolina

Historical Statistics . . . Colonial Times to 1957

Principal consultant—Lawrence A. Harper, University of California

Review consultant—Richard B. Morris, Columbia University

Other contributors—Robert E. Gallman, Ohio State University; Jacob M. Price, University of Michigan; Stella H. Sutherland, Oakland City College, Indiana

Introduction

This volume is the third in the *Historical Statistics* series issued by the Bureau of the Census as a supplement to the annual *Statistical Abstract of the United States.*

Statistics are a valuable adjunct to historical analysis. They often clarify and enrich qualitative history and on occasion become important parts of a historical record on their own. However, users of historical data are faced with the paradox of over-abundance and scarcity. A burdensome multiplicity of sources has frequently to be consulted in order to reconstruct one quantitative aspect of a particular subject. Just as often, users are confronted by a discouraging barrenness of data, discoverable only after much costly work and delay.

The objective of the *Historical Statistics* volumes is to provide a convenient reference source which has two functions, *collecting* and *referring.* The *collecting* function consists of assembling, selecting, and arranging data from hundreds of sources and making them available within a single source. The *referring* function consists of text annotations to the data which act as a guide to sources of greater detail. The annotations also define terms used in the tables and include essential qualifying statements.

The first volume in this series, *Historical Statistics of the United States, 1789–1945,* was published in 1949. It provided a wide range of series quantifying various aspects of the development of the Nation. An interim *Continuation to 1952* was issued in 1954 to provide data for 1946 to 1952 for the still-active series shown in the first volume. Limited resources confined the scope of the first volume to data most readily available, usually from governmental agency sources. Nevertheless, some 3,000 statistical time series were presented.

Historical Statistics of the United States, Colonial Times to 1957, issued in 1960, represented a substantial expansion of the data shown in the original volume. It presented more than 8,000 time series, mostly annual, on a greater variety of subjects and for longer time periods. The statistics were also more fully annotated and more precise references to original sources were provided. For a greater number of series, in addition, there were more detailed descriptions of the development and reliability of the data. A *Continuation to 1962 and Revisions* was issued in 1965, presenting revisions of data in the basic volume and extensions to 1962 of the more than 6,000 series still current at that time.

Each of the first two volumes was prepared with the cooperation of the Social Science Research Council, the guidance of a distinguished Advisory Committee, and the assistance of numerous scholars, research analysts, and particular subject specialists. A description tracing the development of the first two editions appears below under "Origin of Historical Statistics of the United States."

During the latter 1960's, the supply of copies of *Historical Statistics . . . to 1957* available for sale from the U.S. Superintendent of Documents was exhausted. The edition had already been through a cycle of five printings and a question was raised concerning the advisability of further printings in the light of a possible new edition. The question was timely. Experience with the first two editions and their *Continuation* supplements had shown that a new edition was desirable at 10 to 12 year intervals. The *Continuation* supplements were at best handy stopgaps for researchers, a serviceable minimum seriously lacking in documentation. As each year lengthened the interval between editions, the "convenience" value of both the *Continuation to 1962* and its parent *Historical Statistics . . . to 1957* diminished. More and more time series were revised in part or entirely replaced. Further, the task for the user of updating the still active, unrevised, series became more burdensome despite the special efforts of the annual *Statistical Abstract* to maintain a direct linkage to as many historical series as possible in its current tables. As a result, a decision was made in 1969 to begin preparation of a new edition.

The plans for the new edition immediately encountered the problem of funding and resources. It was clearly impractical at that time, given the available resources, to consider undertaking a full-fledged new edition of *Historical Statistics.* The determination to make a start, however, was very strong and more modest objectives were adopted. In effect, the early plans for the present edition proposed that it comprise little more than: (1) An extension to 1970 of those series for which current data were available; (2) revisions of data which had occurred since issuance of the *Continuation to 1962;* and (3) a reprinting of those series in *Historical Statistics . . . to 1957* which had not been affected by either updating or revisions. No time span was specifically set down to complete the work because there was a clear understanding that it was a part-time staff project.

Two other aspects of this plan differed considerably from the procedures followed for the last edition. For that edition, a large number of consultants were enlisted for their expertise in assembling and developing new time series, reviewing and adjusting old time series, and providing explanatory and bibliographic notes for both. Although most of these consultants, especially those in Federal agencies, contributed their own and their agencies services without compensation, many were compensated from funds provided by the Ford Foundation (by arrangement through the Social Science Research Council). For the new edition, given the limited resources, consultants' contributions were recruited on a public service basis entirely. Partly for the same reason, it was decided not to revive the collaboration of the Census Bureau with the Social Science Research Council which had proved so highly effective for the first two *Historical Statistics* editions. Even more convincing for the Bureau decision to undertake the project alone was the solidity of the base which those editions now provided for the next edition. Seeking such collaboration again seemed unwarranted in the light of the modest objectives outlined above.

As the work slowly progressed and as the many consultants and contributors gave generously of their knowledge and talent, it became clear that our objectives were too restrictive; that our contemplated mere updating would, if adhered to, have to ignore a large accumulation of new time series which were either ineligible for the last edition (at that time they covered a period of less than 20 years) or had not been discovered or properly developed prior to that edition. The gradual accretion of new material plus the additions to old material substantially changed the planned scope of the present edition. What follows are some measures of the changes in content introduced in the present edition.

All of the broad subject fields shown as separate chapters in the last edition are included in this edition and follow the same sequence. Within some of the chapters, however, chapter segments have been regrouped into new subchapters (as in chapters K and X) and in others, the sequence of the subchapters has been changed (as in chapters H, Q, and U) to achieve minor improvements in the juxtaposition of subjects.

In two chapters, two entirely new subchapters have been added: "Input-Output Structure of the U.S. Economy" to chapter F and "Flow of Funds" to chapter X.

The present edition presents more than 12,500 time series, a 50-percent increase over the last edition. Every chapter has undergone some expansion with respect to new time series. Chapter F, national income and wealth, and chapter H, social statistics, doubled in num-

ber of series; the former from 345 to 723 and the latter from 543 to 1,170. The increase in chapter F was largely due to newly-added data for economic growth rates, greater detail than was previously shown for national and personal income, and data showing valuation of capital stocks. Unsurprisingly, the largest increase in series occurred in chapter H where the data for social insurance and welfare, education, and crime and correction reflect the great public attention given to these subjects in recent decades. Almost equally large increases took place for chapter K, agriculture, and chapter X, financial markets and institutions (formerly banking and finance); chapter K from 328 series to 623; chapter X from 480 to 962. Partly to accommodate the increase in series, chapter K has been subdivided into 4 parts. Most of the new series in chapter K relate to farm population and farm-operator characteristics, farm marketings, government payments and price supports, and a number of new measures of farm productivity. For chapter X, the bulk of the increase in series is in the new flow-of-funds subchapter.

Several chapters now include for the first time a number of data series below the national level. In all, there are 13 new tables (comprising 484 series) in this category, 9 of which present data for the individual States and 4 for either regions (e.g. the South or the West) or the smaller geographic divisions (e.g. New England, South Atlantic). Perhaps of special interest among these tables are the series on population characteristics and land area for each State (A 195–263), those on selected items for farms and farm population by State (K 17–81), those on voter participation in presidential elections by State (Y 27–78), and those on population censuses taken in the colonies and States during the colonial and pre-Federal period (Z 24–132).

In addition, each of 4 chapters (D, G, Q, and Z) includes at least 200 or more new series and each of 10 chapters (A, B, L, N, P, S, T, U, V, and Y) includes 100 or more. A summary of selected new series included in each chapter is shown on p. XV.

One other important change is the reinstatement of a time period index (see p. A–4) which first appeared in *Historical Statistics . . . , 1789* to *1945*. The index enables users to identify quickly which time series (or statistics for particular subjects) begin in the specified 10- or 20-year time segment (e.g. 1800–1819, 1820–1839).

As a result of the complete review and updating of the contents of the last edition of *Historical Statistics*, many changes, apart from the entirely new series, have occurred in both the tables, the descriptive text, and the bibliographic notes. Most of the changes are due to revisions and corrections made during the interval between the last and present editions by the sources of the data affected. Where users of both editions become aware of discrepancies in what purport to be identical sets of data, it is safe to assume that the figures, descriptive text, and notes in the present edition supersede those in the last edition.

With rare exception, all of the series shown in the last edition are also included here. 76 series were omitted. They were primarily discontinued series replaced on recommendations of consultants by other series of a similar kind or were considered of marginal importance or relatively weak in other respects. In one or two instances, space was also a factor.

Origin of *Historical Statistics of the United States*

The first edition, *Historical Statistics of the United States, 1789–1945*, was formally initiated by a recommendation in 1945 by the Social Science Research Council that the Secretary of Commerce consider compilation and publication by the Bureau of the Census of a source book of economic statistics.

Earlier the same year, J. Frederic Dewhurst urged the development of an historical source book in a proposal to the American Statistical Association and the American Economic Association. A joint committee was named by these associations, joined by the Economic History Association, to explore the practical problems of preparing such a volume. Dr. Dewhurst's proposal coincided closely with Bureau of the Census plans to prepare an historical supplement to the *Statistical Abstract of the United States*. The formal decision in 1945 by the Bureau of the Census to compile and publish such a volume led to the reconstitution of the joint committee, which then became the Social Science Research Council Committee on the Source Book of Historical Statistics, Advisory to the Bureau of the Census.

After the first edition was issued in June 1949, the Economic History Association, in response to a request from the Bureau of the Census, appointed an advisory committee in September 1950 to evaluate the volume and to make specific recommendations affecting the question of its revision. This committee, formally designated as the Committee of the Economic History Association on the Revision of *Historical Statistics of the United States, 1789–1945*, was under the chairmanship of G. Heberton Evans, Jr., The Johns Hopkins University, and included the following as members: Arthur H. Cole, Harvard University; Shepard Clough, Columbia University; T. C. Cochran, University of Pennsylvania, and Solomon Fabricant, National Bureau of Economic Research, Inc. In April 1952 the committee submitted a report to the Bureau of the Census entitled "On the Revision of *Historical Statistics of the United States, 1789–1945*." The conclusions and comments presented in this report were subsequently influential in getting underway the project for a revised volume.

For the second edition, *Historical Statistics of the United States, Colonial Times to 1957*, the Bureau designated a project director who also acted as secretary of the Committee on Historical Statistics appointed by the Social Science Research Council to serve as an advisory group similar to the committee which participated in the preparation of the first edition. The Census Bureau again assumed the responsibility for publishing the volume as a part of its *Statistical Abstract* program. The Social Science Research Council, in turn, obtained a grant from the Ford Foundation which provided funds for the procurement of services of experts in each field. More than 125 such specialists were engaged to serve as consultants. The Council also made arrangements with some of the consultants for the preparation of bibliographic essays on statistics in selected fields, five of which were subsequently published in the *Journal of the American Statistical Association*.

The Problem of Historical Statistics

The scattered sources of historical statistics of the United States include the annual reports of the executive heads of the agencies of the Federal Government, reports of special Federal commissions, the U.S. census volumes, printed debates of the Congress, published reports of committees of the Congress and transcripts of hearings on important legislative measures, published reports and documents of the State governments, statistical publications of private research organizations and of the universities and colleges of the Nation, together with the great mass of statistical volumes printed by other private organizations and individuals.

It has been noted that on occasion compilers, desiring to save the time and effort required to obtain data directly from the original sources, make use of successive issues of the annual *Statistical Abstract of the United States* to construct long-term time series. The results of such a procedure are not always sound, since the space available in the *Statistical Abstract* for describing major revisions in time series may not permit adequate clarification. Of the many revised figures appearing in each issue, most revisions apply to the immediate preceding years, but revisions of much earlier years are not uncommon. Moreover, the revisions shown have followed no systematic pattern and may be scattered irregularly over many issues.

Impediments to the use of historical statistics, then, include the initial difficulty of determining whether the data in fact exist, of identifying the document in which the data may be found, of constructing time series where the data may not be arranged in suitable form, and of identifying and interpreting changes in concept and

coverage. Definitions employed in published historical tables, moreover, may have to be sought in separate publications if, indeed, they have been published at all.

Technical Notes and Explanations

Arrangement of the data. Data are arranged for broad subjects in lettered chapters and for more specific and detailed subjects in numbered series within each chapter. To facilitate reference, subject groups are organized in summary form under chapter and subchapter titles in the table of contents (p. IV). In addition, there is a detailed alphabetical subject index (p. A–10). The data are presented in conventional tabular form, each table comprising a group of subject-related series. Each series or tabular column is assigned a unique letter and number. The letter prefix identifies the chapter and the number represents the order of the series in the chapter. Thus the 44th series in the chapter on agriculture is designated K 44 to distinguish it from the 44th series in the chapter on transportation, Q 44. Because of possible confusion with numerals, the capital letters I and O have been omitted in identifying chapters. Source citations and descriptive text material (see below) are linked to the data series by use of the assigned series numbers.

All series begin with the most recent year for which data have been obtained and run backward in time. This arrangement was selected because it lent itself to more compact, less space-consuming presentation than the alternative of beginning with the earliest year. Insofar as possible, there are uniformly placed spaces above every year ending in 0 or 5. No data are shown for years subsequent to 1970. Figures for later years for most of the current series are presented in the *Statistical Abstract of the United States* beginning with the 1973 edition.

Basic guidelines. The guidelines adopted for this edition to aid Census Bureau staff members, subject matter consultants, and other participants with respect to selection and presentation of the data are quite similar to those of the last edition. As was the case then, however, the guidelines were not followed with complete rigidity. At times, the scope, variety, and complexity of the data involved made it necessary to modify the rules for the sake of clarity or internal consistency. The guidelines applied and the elements subject to application are discussed below.

Area coverage. Except as otherwise specified, data generally represent conterminous United States or the 48 States (including the District of Columbia) prior to the admission of Alaska and Hawaii to statehood and the 50 States thereafter. Asterisks on individual tables or series indicate the first year for which the figures include Alaska and Hawaii to the extent that their inclusion could be ascertained. For some series, especially in chapter K, the notes specifying inclusion or exclusion of Alaska and Hawaii appear in the text. In some instances, the sources used for data failed to specify the area covered. Where practicable, the data were examined and the appropriate qualifications were added.

Because of limitations of space, data are not generally shown for regions, States, or localities. Some exceptions were permitted, however, as noted above with respect to data for regions and States. Other exceptions were of a more specialized nature as in the following instances: Where regional statistics are helpful for correct interpretation of data, such as presentation of merchant marine statistics separately for each coast and for inland waters; where data in the subject field cannot (by definition) be summarized effectively for the United States, such as internal migration data; where summary data for a given subarea or market are indicative of general trend or level, such as prices on the New York Stock Exchange or in specified cities; where data for a given area effectively represent the national picture because of concentration of production, etc., as Pennsylvania anthracite; where data are available for only a given area as in the case of many series concerned with early American history and limited to the Atlantic seaboard.

Time coverage. In general, only annual or census-period data which cover at least 20 years are presented. A major exception was made for series covering the colonial or pre-Federal period. Other exceptions were permitted where newly developed series of recent origin were the only data available to represent an important subject field or where a short series was an important extension of other longer series.

The general requirements as to time coverage were specifically designed to permit inclusion of "lapsed" series, particularly those falling within the nineteenth century or extending into the early twentieth century. The lapsed series, which begin and terminate in the past, represent major fields of interest during various phases of American historical development; frequently they must be sought in out-of-print documents which are available in few libraries.

The identification of time-periods was complicated by failure of some sources to state whether the data were prepared on a calendar-year or on a fiscal-year basis; by shifts in time coverage from calendar to fiscal year during the period of the series, and, in some instances, by the lack of identification of the beginning or ending date of the fiscal year. In all such cases, particularly where time shifts seemed likely to have occurred, an effort was made to identify the correct basis.

Frequency of data. Annual data are given preference but certain series are presented only for years in which a national census was conducted, and, in some instances (for example, telephone and telegraph rates), only for the scattered dates for which the data are available. Where both annual figures and decennial or quinquennial benchmark or census data exist, both series are frequently shown.

Series linkage. No formal attempt was made to extend a single series back through time by linking it to another series which terminated at or near the date on which the first began. In a number of instances, however, such series are presented in adjoining columns, with an overlap for a period of years, when available.

Selection of data. The criteria of selection varied broadly, depending on a number of factors applicable to the subject matter involved. Generally, summary measures or one-dimensional aggregates at gross levels and immediately below were given highest priority for inclusion. Below such levels, selection was governed by the interplay of: The amount of space already devoted to a particular subject; the attempt to achieve a relatively balanced presentation among subject fields; the "uniqueness" (in the sense that other data did or did not fairly cover a particular subject) of the data; the quantity of data available; the quality of the data available; and the extent to which data might be related to and enhance the value of other data.

Among less discretionary factors, both area detail (see above under area coverage) and subject detail, such as cross-classifications or data for specific commodities, were held to a minimum because of space limitations. Inevitably, there were exceptions where synthesis or summarization did serious damage to the value of a series or where it was clearly more meaningful to show series for specific commodities than a group aggregate.

Presentation of absolute rather than derived data. Primary emphasis was placed on the presentation of absolute figures rather than on derived data since the absolute figures offer somewhat greater flexibility to the user. The major exception was the presentation of index numbers. In general, percentage distributions of absolute data already shown are not presented. Other percentage data, and averages, medians, ratios, and rates were used only where they resulted in a significant economy in space or where they significantly facilitated interpretation. No attempt was made to convert various series of index numbers to a base year or period other than that shown in the source. Large numbers (8 digits or more, for example) shown in the source documents have been rounded to thousands, millions, or billions for ease of use and reference only as staff resources allowed.

Omissions of data, "blank" cells. The significance of dashes in tabular cells varies from series to series. In general, the presence of cell "leaders" or "dashes" indicates merely that no information was provided. Dash entries may mean that no information exists for the given year; the entry, if shown, would be zero; the information

was not available; or the information is believed to exist in published form but it was not practicable to do the research necessary to locate the appropriate source. The user will have to judge from the context which meaning is appropriate in each particular instance.

The practices of the various sources of information differ as to the meaning of dashes in cells, the extent to which they label data as "not available," the meaning of the term "not available," the use of the zero entry, etc. In general, the policy adopted in preparing this volume was to retain "not available" notations where they appeared for intermediate years in the series; to change them to dashes where they appeared at the beginning or end of the series. Where cells were left blank in the sources, they were filled with dashes unless there was evidence that "not available" was a more appropriate entry.

Since series of varying length taken from different sources are frequently found in adjoining columns in a table, the stub listings for years necessarily encompass the earliest and latest date for which any of the series in the table are shown. In itself, this tends to create many additional blank cells since missing entries have been replaced by dashes in order to make it easier for the user's eye to trace the entries for a given year across the entire table.

Source citations and text. For every series shown, the text notes present the source or sources of the data. In most cases, precise publication dates and page or table numbers are given. However, where numerous issues of a certain publication were used, the source citations are usually limited to "annual issues," "various monthly issues," or similar notations. The term "unpublished data" means that the data were not in published form at the time they were obtained for use in this edition. In many cases, such data were scheduled for inclusion in forthcoming publications.

Where possible the descriptive text includes definitions of concepts and terms used, and sufficient methodological and historical information to permit intelligent use of the data. For many series the text also includes reference to where more detail can be found. Unusual values in a series are explained and major changes which affect comparability are noted. Methods used for adjusted or derived figures are described, often with reference to a more complete description.

Copyright material. Copyright restrictions, where applicable, are noted in source citations. Permission to quote or reprint copyright material should be obtained directly from the copyright owner.

Statistical Reliability and Responsibility

The contents of this volume were obtained from a large number of sources. All data from either censuses and surveys or based on estimates or administrative records are subject to error arising from a number of sources: Sampling variability (for statistics based on samples), reporting errors in the data for individual units, incomplete coverage, nonresponse, imputation, and processing error. The Bureau of the Census cannot accept responsibility for the accuracy or the limitations of data presented here, other than for those which it collects. Every attempt has been made, within the limits of time and available personnel, to verify and correctly identify the material. Final responsibility for selection of the material, and for its accurate and proper presentation, rests with the Bureau of the Census, even though carried out with the cooperation of many individuals and agencies who devoted much time and energy in providing data and descriptions of series for this publication.

The information presented in this volume supersedes all similar information presented in *Historical Statistics of the United States, Colonial Times to 1957*, and in *Historical Statistics of the United States, Colonial Times to 1957: Continuation to 1962 and Revisions.*

FOR ADDITIONAL INFORMATION ON DATA PRESENTED

please consult the source publications available in local libraries or write to the agency indicated in the source note in the descriptive text for the given statistical series. Write to the Bureau of the Census only if it is indicated as the source.

SUGGESTIONS AND COMMENTS

Summary of Selected New Series in This Edition

Chapter and title	Number of new series	Summary of selected new series
A. Population	198	Urban population characteristics (A 82–90); foreign born, by sex and race (A 105–118); population characteristics and land area, by States (A 195–263); households, by number of persons (A 335–349); inmates of institutions (A 359–371)
B. Vital Statistics and Health and Medical Care	180	Fertility and birth rates, by age of mother (B 11–19); illegitimate births and rates (B 28–35); health expenditures (B 221–261); hospital use rates, expenses, personnel, and insurance coverage (B 381–422)
C. Migration	36	Aliens naturalized (C 162–167); passenger arrivals and departures (C 296–331)
D. Labor	227	Working women (D 49–74); unemployment rates (D 87–115); employee output (D 683–704); employee earnings (D 705–786); union membership and work stoppages (D 927–939, D 986–1021)
E. Prices	22	GNP implicit price deflators (E 1–22)
F. National Income and Wealth	362	GNP growth rates and per capita (F 10–31); GNP summary and by type of industry (F 32–46), F 130–162); national and personal income (F 163–209, F 250–348); national tangible assets (F 349–376); value and age of capital stocks (F 470–534)
G. Consumer Income and Expenditures	292	Distribution of families and persons, by money income levels (G 1–268); nutritive value of city diets (G 857–865); food used at home (G 866–880)
H. Social Statistics	675	Employee benefit plans (H 70–114); OASDHI (social security) coverage, benefits, and trust fund (H 186–259); Civil Service retirement (H 260–270); private philanthropy (H 398–411); schools and school enrollment (H 418–432, H 442–522); school retention rates (H 587–597); income, by years of school completed (H 648–663); illiteracy (H 669–688); doctorates, by field (H 766–787); foreign travel, passports issued, and foreign visitors to U.S. (H 894–951); crimes and crime rates (H 952–961); homicides and suicides (H 971–986); criminal justice expenditures (H 1012–1027); lawyers (H 1028–1062); courts (H 1063–1124)
J. Land, Water, and Climate	15	Indian lands (J 16–19); tornadoes, floods, and cyclones (J 268–278)
K. Agriculture	315	Farm population, land in farms, farm property, farm products sold (K 1–81); farm operator characteristics (K 82–108); balance sheet of farming and value of gross farm product (K 204–239); farm income and farm marketings (K 256–343); farm productivity (K 407–495)
L. Forestry and Fisheries	153	Forest products production, imports, exports, and consumption (L 56–71, L 87–97, L 138–165, L 178–198); fishery imports and exports (L 224–235); value of landed fish catches (L 244–253); prices received by fishermen (L 321–337)
M. Minerals	26	Employment and man-hours in mineral industries (M 287–306)
N. Construction and Housing	120	Wholesale price indexes for construction materials (N 140–155); new publicly-owned housing starts (N 171–179); value and mean age of stocks of residential structures (N 200–231); housing vacancy rates (N 246–258)
P. Manufactures	132	General statistics (P 58–67); horsepower of power equipment (P 68–73); shipments, inventories, and orders (P 74–92); corporation sales, profits, and equity (P 93–106); shares of largest companies (P 177–204); consumption of selected commodities (P 216–230)
Q. Transportation	240	Intercity passenger traffic (Q 1–11); revenues and employment, by type of transport (Q 23–46); intercity motor carriers (Q 69–81); long-term public highway debt (Q 136–147); motor vehicle insurance, ownership, and financing (Q 163–186); motor vehicle speed, miles of travel, and accidents (Q 187–232); merchant vessels built, repaired, launched, and active (Q 438–480, Q 487–502)
R. Communications	53	Cable TV (R 98–101); radio and TV finances (R 113–120, R 130–137); new books published (R 195–217); newsprint consumption (R 218–223)
S. Energy	124	Consumption of raw materials and fuel resources (S 15–31); privately-owned electric utility generating plants and balance sheet and income items (S 58–73, S 133–146); REA summary of operations (S 147–159); waterpower (S 160–175); natural gas consumption and gas utility industry (S 178–218)
T. Distribution and Services	100	Annual earnings of full-time employees (T 29–42); legal form of organization of industries (T 43–57); merchant wholesalers sales and stocks (T 375–383); index of national advertising expenditures (T 472–484)
U. International Transactions and Foreign Commerce	155	Value of direct foreign investment in U.S. (U 47–74); U.S. Government foreign grants and credits (U 75–186); exports and imports, by broad end-use class (U 249–263)
V. Business Enterprise	115	Number of firms, by type of ownership (V 1–12); income of unincorporated firms (V 66–77); manufacturing and trade sales and inventories (V 78–107); gross product and unit costs of nonfinancial corporations

Summary of Selected New Series in This Edition—Con.

Chapter and title	Number of new series	Summary of selected new series
		(V 141–166); business expenditures for new plant and equipment (V 306–332)
W. Productivity and Technological Development	60	Indexes of output per man-hour and per employed person (W 22–29); funds for research and development (W 109–125, W 161–167); employment of natural scientists and engineers (W 168–180)
X. Financial Markets and Institutions	517	Flow of funds (X 1–392); sales of stocks and bonds on registered exchanges (X 517–530); savings and other time deposits, by institution (X 687–697); assets and liabilities of mutual savings banks and savings and loan associations (X 821–844); selected items of property-liability insurance (X 918–932); stock and mutual insurance companies (X 933–956)
Y. Government	158	Voter participation in presidential elections (Y 28–78); costs of presidential elections (Y 187–188); congressional bills vetoed (Y 199–203); Federal Government full-time civilian employment (Y 318–331); Federal grants to State and local governments (Y 638–651); selective service registrants (Y 917–926); defendants charged with violation of selective service acts (Y 927–942)
Z. Colonial and Pre-Federal Statistics	200	Population censuses taken in the colonies and States (Z 24–132); components of private wealth for the thirteen colonies (Z 169–191); exports to and imports from Scotland, by colonies and States (Z 227–244); commodity imports and exports, shipping earnings, and value of slaves imported (Z 286–290); vessels built in colonies and West Florida (Z 510–529)

Chapter N

Construction and Housing

Construction (Series N 1-155)

N 1-60. General note.

On July 1, 1959, full responsibility for compiling and publishing value-in-place estimates for new construction was placed in the U.S. Department of Commerce. Prior to that date, the U.S. Department of Labor was responsible for the estimates of value of private housekeeping residential construction and of all public construction, and the U.S. Department of Commerce was responsible for the estimates of all other new construction, of maintenance and repair expenditures, and of expenditures in constant prices for all types of construction.

Specific definitions of the terms used here and discussion of sources and methodology are given in the source publications. New construction includes the complete, original erection of structures and essential service facilities, as well as major additions and alterations. It does not include mobile structures, special purpose equipment (e.g. steam tables in restaurants, printing presses, refrigerators and dishwashers, church pews, etc.), demolition of structures if not part of a construction contract, oil and gas well drilling, digging and shoring of mines, and farming operations such as plowing, terracing, or digging of drainage ditches.

The value of construction put in place is a measure of the value of construction installed or erected at the site during a given period. For an individual project, this includes the cost of material installed or erected, the cost of labor performed (both by the contractors and by force account employees) and a proportionate share of the cost of construction equipment used, the contractor's profit, the project owner's overhead costs, the cost of architectural and engineering work, and miscellaneous costs chargeable to the project on the owner's books.

The total value in place for a given period is the sum of the value put in place on all projects underway during this period, regardless of when work on each individual project was started or when payment was made to the contractors.

The estimates do not always conform completely to the value-in-place concept. For some categories, the published estimates represent payments made during a period rather than the value of work actually done during that period. For other categories, the estimates are derived by distributing the total construction cost of the project in accordance with fixed construction progress patterns.

Estimates of the value of new construction by States are available only for 1939–1952 in Department of Commerce, *Construction and Building Materials, Statistical Supplement*, "New Construction by Regions and States, 1939–1952."

Significant revisions in basic data were made for all or part of the period beginning in 1960 in four categories: New private housing units, private nonresidential buildings, farm construction, and privately owned public utilities. These revisions are noted in the text for those series.

The estimates for other series have only small revisions made necessary by the incorporation of newly available basic data.

Except as indicated in footnotes, all these series are essentially comparable back to 1946, as the result of revisions made in 1964 to establish historical comparability. For series N 1-29, two sets of data are given for 1946 in order to show comparability also between 1946 and earlier years. For a description of the revisions beginning with 1946, see Bureau of the Census, *Construction Reports*, series C 30-61 Supplement, October 1964.

N 1-29. Value of new private and public construction put in place, 1915–1970.

Source: 1915–1957 (except as indicated in footnote 9), U.S. Business and Defense Services Administration, *Construction Statistics, 1915–1964*, a supplement to *Construction Review*, January 1966, pp. 2–7. 1958–1970, U.S. Bureau of the Census, *Construction Reports*, series C 30-74-5, pp. 8 and 9, and unpublished data.

N 1-3, total new, total new private, and total new private residential construction. Series N 1 is the sum of series N 2 and N 19; series N 2 is the sum of series N 3, N 7, N 11, N 12, and N 18; series N 3 is the sum of series N 4–6.

N 4, new housing units. This series covers all new houses and apartments, including housing at all levels of value and quality, such as prefabricated units, shell houses, basement (or capped) houses, and houses built of used materials. The estimates for 1941–1970 are based on monthly reports of the value of new housing units authorized by local building permits and on monthly field surveys in a sample of areas not issuing building permits. Values in building permit reports are adjusted to reflect the construction cost of housing units in all permit-issuing places, reporting and nonreporting, to compensate for the typical understatement of costs in permits, and to allow for lapses of permits. The permit and nonpermit segments are then combined and further adjustments are made to cover architect and engineering fees and site development costs not covered elsewhere. An expenditure pattern is developed for these adjusted estimates of total costs to estimate the amount of work put in place in the months following start of construction. Beginning 1960, this series was revised to incorporate the results of new procedures and to include farm housing, which was previously included in the farm series. In this volume, series N 4 includes, and series N 11 excludes, farm housing (shown separately in the first source cited) for all years except 1958 and 1959.

For 1921–1940, the data are based mainly on the value of permits issued during each year, with rough adjustments for nonreporting permit areas and nonpermit areas and for the other items mentioned above. Only slight adjustment is made for year-to-year differences in the amount of carryover of expenditures for units started near the end of the year. The estimates for 1915–1920 are projected back from the 1921–1922 average by using link relatives indicated by year-to-year changes in the value of residential building contracts awarded as reported by the F. W. Dodge Corporation.

Residential construction expenditures for new 1 unit- and 2 or more unit-structures are presented in *Construction Reports*, series C 30, beginning with data for 1960. For a rough segregation of residential construction expenditures into 1- to 4-family housing and multifamily housing, see Raymond W. Goldsmith, *A Study of Saving in the United States*, vol. I, Princeton University Press, 1955, table R-28.

Series N 4 excludes group quarters, transient accommodations, residential units in buildings which are primarily nonresidential, new units provided by conversion of residential or nonresidential space to additional housing units, mobile homes, house trailers, and houseboats.

N 5, residential additions and alterations. This series includes all remodeling of or additions to housing units subsequent to their original completion, the construction of additional housing units in existing residential structures, the finishing of basements or attics, and

the modernization of kitchens, bathrooms, etc. Work representing normal maintenance and repair is not included.

Private residential construction is the only type of construction activity for which the source publishes estimates of additions and alterations separately, and the data cover housekeeping structures only. For a discussion of the problems of estimating dependable data on residential additions and alterations, particularly prior to 1960, see Marvin Wilkerson, "Revised Estimates of Residential Additions and Alterations, 1945–56," *Construction Review*, June 1957.

N 6, nonhousekeeping residential buildings. These include fixed structures providing residential facilities other than housekeeping units, such as hotels (other than apartment hotels), motels, dormitories, nurses' homes, etc. The sources and estimating procedures are the same as those for private nonresidential building. Revised data were introduced for 1968 through 1970. They were obtained from the Bureau of the Census' newly introduced Progress Reporting Survey for the 13 Western States, and 37 Eastern States which accounts for an average of about 23 percent of this series.

See also text for series N 7–10 and series N 78–100.

N 7–10, new private nonresidential buildings. Estimates are based on monthly records of the value of contract awards in the District of Columbia and the 37 States east of the Rocky Mountains, as compiled by the F. W. Dodge Division of the McGraw-Hill Information Systems Company (see text for series N 78–100). These were adjusted for undercoverage, cancellations, and duplication of construction reported by public utilities. Prior to 1968, data for the 13 Western States were derived by applying an adjustment factor to the data for the Eastern States. Beginning 1968, the series are based not only on the previously used survey data for the 37 Eastern States but also on the results of the new survey covering the 13 Western States (see text for series N 6). The net effect of the new procedure was to lower the estimates for total new private nonresidential building construction for 1968 by 3.4 percent in comparison to the old method. In order to maintain a continuous series, the estimates for total private nonresidential building were adjusted. The previously published totals were reduced starting in 1965 and continuing through 1967, i.e., 0.1 percent decrease in March 1965, 0.2 percent in April, etc. down to the 3.4 percent decrease in December 1967. A corresponding adjustment could not be made by type of construction for those years.

Also beginning 1968, the classification system for new projects was revised from a building basis, i.e., the classification of the building itself, to an establishment basis, i.e., classification based upon the classification of the establishment at which the construction is taking place or classification of the entire project of which the individual building or subproject is part. For example, under the new classification, a cafeteria building at a hospital is classified under hospital and institutional; under the previous classification, following an adjustment in the data, it would have been classified as commercial.

Through June 1962, the adjusted value of monthly contract awards is converted to monthly estimates of expenditures on the assumption that all projects are started in the month following the contract award and on the basis of an expenditure pattern over subsequent months. Beginning July 1962 (January 1968 in the 13 Western States), monthly estimates of expenditures are derived from a monthly survey of construction progress.

N 11, farm construction, nonresidential. This series includes buildings and structures such as barns, storage houses, smoke houses, wells, fences, etc., which are constructed on places classified as farms. Annual estimates of total expenditures on farm buildings are prepared by the Economic Research Service of the U.S. Department of Agriculture. They are based chiefly on data from sample surveys of construction expenditures of farm operators for 1934–1937, 1939, 1946, 1949, 1955, and 1971. Estimates for other years are made by interpolation and extrapolation, based in part on inferences from relevant data reported in Bureau of the Census, *Current Industrial Reports*, and in part on regression analyses of selected series of farm income and construction expenditures for past benchmark years.

N 12, total, privately owned public utilities. This series is the sum of series N 13–17. Recent revisions for public utilities result from the incorporation of late basic data for the years 1967 through 1969 and from revision of estimating procedures in 1970.

N 13, railroad. Railroad estimates are based on an annual summary of construction expenditures prepared by the Interstate Commerce Commission from reports by all Class I railroads which account for over 95 percent of all railroad expenditures. These data are adjusted to include estimates for Class II railroads based on ICC data on railroad investment in roads and equipment. Prior to 1955, local transit estimates of capital and maintenance expenditures were included from the annual *Transit Fact Book* of the American Transit Association. Outlays by municipally owned transit companies were deducted from these expenditures. The estimates for 1955–1958 are projections based on an assumed gradual decline in expenditure from the 1954 level to zero in 1959. For both railroads and local transit, the estimates for 1915–1921 are extrapolations based on miles of track added or rebuilt.

N 14, petroleum pipeline. Capital expenditures on pipelines for 1919–1970 were obtained from reports filed with the Interstate Commerce Commission. Adjustment was made for the purchase of existing lines and for expenditures by companies not required to file information with the Commission on the basis of data on gross capital investment compiled by the Chase Manhattan Bank. Only rough estimates by the Bureau of Foreign and Domestic Commerce are available for 1915–1918.

N 15, electric light and power. Annual estimates are based on reports to the Federal Power Commission by privately owned electric companies and on data reported to the Rural Electrification Administration by REA cooperative companies. For 1937–1970, annual additions to electric plants reported to the Federal Power Commission were adjusted to include small companies not reporting and to allow for work in progress and existing property purchased. For 1921–1936, data from the Edison Electric Institute were used. For 1915–1920, the data are based on an estimated year-by-year distribution of the 5-year increments in plant and equipment derived from data reported in the Census of Electrical Industries for 1912, 1917, and 1922.

N 16, gas. Annual estimates are based on reports to the Federal Power Commission and data compiled by the American Gas Association. For 1929–1970, annual data published by the American Gas Association were adjusted to eliminate equipment expenditures. For 1915–1928, estimates were obtained by extrapolation on the basis of year-to-year changes in the fixed capital accounts of 50 large gas companies.

N 17, telephone and telegraph. Estimated construction expenditures of the telephone industry for 1915–1970 were obtained from the American Telephone and Telegraph Co.; they include expenditures for Bell System companies and estimates for independent companies. Construction expenditures of the telegraph industry were derived from capital expenditures reported by the Western Union Telegraph Co. for 1927–1970 and by the Postal Telegraph and Cable Co. for 1919–1943. Extrapolation back to 1915 was made on the basis of annual increments in the value of plant and equipment.

N 18, all other private construction. This series includes unclassified items such as private dams and reservoirs not constructed by public utility companies, sewer and water installations, roads, bridges, parks and playgrounds, and airfields.

N 19, total new public construction. This series is the sum of series N 20–21 and N 25–29. The distinction between private and public construction is made on the basis of ownership rather than source of funds. Some types of private institutional construction involve Federal, State, or local aids to projects built by nonprofit organizations. To this extent, the public construction estimates do not account for all public expenditures for new construction.

N 20, public residential construction. The estimates are based on reports of the Public Housing Administration, the New York City

Housing Authority, and other State and local agencies. They include direct Federal construction during World War I, the depression of the 1930's, and the defense and World War II periods (1940's); the Federal low-rent public housing program initiated in 1937 and executed by State and local agencies with Federal loans and grants; similar programs executed by State and local agencies without Federal aid; and the Veterans Temporary Re-Use Housing Program of the Federal Government initiated in 1945 and terminated in 1950. For the number of housing units under the major programs, see series N 180–191.

Most of the estimates for federally owned construction are based on monthly reports from Federal bureaus and agencies administering residential construction programs. In a few instances, they are based on information presented in the Federal budget documents.

For State and local residential construction prior to 1963, the estimates are based on contract award data compiled from various sources, such as the F. W. Dodge Corporation, the Public Housing Administration, regional offices of the Housing and Home Finance Agency, and State and local agencies responsible for construction of public housing. For 1963–1968, the estimates are based on quarterly expenditures data obtained by the Census Bureau in its quarterly survey of construction expenditures of State and local governments. Beginning 1968, they are based on monthly data on new construction expenditures of State and local governments collected by the Census Bureau in a monthly survey inaugurated with reports for October 1968.

N 21–24, public nonresidential buildings. Series N 21 is the sum of series N 22–24. For Federal construction and State and local projects under Federal-aid programs, the estimates are based on reports of Federal agencies since 1941. For prior years, and for public construction other than Federal or Federal-aid projects prior to 1963, they were derived from the compilations of contract awards by the F. W. Dodge Corporation, adjusted as explained in the text for series N 7–10. For years beginning 1963, see text for series N 20.

N 25, military facilities. This series covers certain construction owned by the Department of Defense, such as troop housing, administration and training buildings, warehouses, mess halls, recreation centers, educational facilities, airfields and airport buildings, missile sites, etc. It also covers construction of Coast Guard facilities.

Estimates for 1940–1970 are based on monthly reports by the Department of Defense. Navy Department construction expenditures for 1915–1936 were derived from special tabulations of the Bureau of Supplies and Accounts. Expenditures of the Navy for 1937–1939 and the War Department for 1915–1939 are based upon expenditures shown in various issues of Bureau of the Budget, *Budget of the United States Government.*

N 26, highways, roads, and streets. This series includes streets, bridges, vehicular tunnels, viaducts, and forest and park roads owned by Federal agencies other than the Department of Defense. It also includes the following items if built in connection with a Federal road: Culverts, right-of-way drainage, erosion control, lighting, guard rails, and earthwork protective structures.

For 1921–1962, estimates for State-administered highways are based on annual reports of the Bureau of Public Roads adjusted to include expenditures by county, municipal, and other local bodies. The adjustments are based upon ratios developed from the analysis of total highway construction and State highway construction. For years beginning 1963, see text for series N 20. Estimates for 1915–1919 were derived from the 1920 *Yearbook of Agriculture.* The 1920 estimates were obtained by straight line interpolation.

N 27, sewer and water systems. For 1915–1942, estimates are based upon data published annually in Bureau of the Census, *Financial Statistics of Cities.* Using the expenditure patterns of the city-size groups reporting, expenditure ratios were derived for the smaller municipalities and rural incorporated areas. For 1943–1962, estimates are based upon contracts awarded as reported by the F. W. Dodge Corporation with adjustments for undercoverage. For years beginning 1963, see text for series N 20.

N 28, conservation and development. For 1915–1942, expenditures for reclamation, improvement of rivers and harbors, and flood control work were derived from annual reports of the Corps of Engineers and the Bureau of Reclamation. The fiscal-year basis of the reports was converted to calendar year by taking one-half of the figure for each fiscal year included within that calendar year. For 1943–1970, estimates are based upon project reports furnished by the same two agencies. Tennessee Valley Authority expenditures are available in its annual reports. For Bureau of Indian Affairs, Forest Service, National Park Service, Soil Conservation Service, Bonneville Power Administration, Office of Saline Water, Southwestern Power Administration, International Boundary and Water Commission, and St. Lawrence Seaway Development Corporation, expenditures were derived from special tabulations prepared by those agencies and from the Office of Management and Budget, *Budget of the United States Government.*

The estimates, with minor exceptions for earlier years, refer only to expenditures by the Federal Government. State and local government expenditures for this type of construction are included in "All other public," series N 29.

N 29, all other public construction. This series combines "miscellaneous public service enterprises" and "all other public construction" shown separately in the source. Construction expenditures by Federal agencies not included in other series are, for the most part, based on monthly or quarterly reports of the agencies or, in cases of minor or occasional construction work, derived from fiscal-year data in the Office of Management and Budget, *Budget of the United States Government.* Outlays for municipal public service enterprises prior to 1963 were obtained directly from the municipalities or estimated from information reported in Bureau of the Census, *Financial Statistics of Cities.* Miscellaneous public construction estimates prior to 1963, other than those of the Federal Government, were derived primarily from reports of contracts awarded, compiled by the F. W. Dodge Corporation, from the *Engineering News-Record,* and from other publications reporting contract awards. For years beginning 1963, see text for series N 20.

N 30–60. Value of new private and public construction put in place, 1957–59 dollars, 1915–1970.

Source: 1915–1959, see first source for series N 1–29, pp. 8–12. 1960–1970, U.S. Bureau of the Census, *Construction Reports,* series C 30, various issues.

Measurement of construction expenditures in constant prices is an indirect way of approximating changes in the physical volume of construction. These estimates are based on a deflation of each type of construction by an appropriate construction cost index. For a description of the cost indexes used for each type of construction, see the source publication.

These series, revised back to 1947 on a 1967 constant dollar base, are scheduled for issuance in 1975.

Beginning 1946, data are not entirely comparable with those for earlier years; see text for series N 1–29.

N 61. Construction expenditures for maintenance and repair, 1915–1963.

Source: See first source for series N 1–29.

The estimates are, in general, much less reliable than those for new construction and, to judge from past revisions and occasional partial surveys, probably understate actual expenditures.

Estimates of nonfarm residential building for 1947–1963 are based on the annual *Survey of Consumer Finances* of the Board of Governors of the Federal Reserve System, the consumer expenditure survey for 1950 by the Bureau of Labor Statistics, and a 1950 survey of outlays of owners of tenant-occupied dwelling units by the Office of the Housing Expediter (conducted for purposes of rent control). Data for earlier years are based on estimates of the value of all residen-

tial properties and on ratios of maintenance and repair expenditures to value. These ratios were derived from various studies, such as surveys of consumer purchases by the Department of Agriculture and the Department of Labor, and wartime surveys made for purposes of rent control.

Estimates for nonresidential building are based on corporate income tax returns covering manufacturing activities; cost analyses for office buildings in the National Association of Building Owners and Managers, *Experience Exchange Reports;* and reports by State school agencies to the Office of Education.

Other maintenance expenditures were estimated from the same sources used for the new construction figures. See text for series N 11–18 and N 21–29.

The source also presents maintenance and repair expenditures for major classes of construction. Beginning 1964, maintenance and repair expenditures are available for residential construction only; see Bureau of the Census *Residential Alterations and Repairs*, series C 50.

N 62–65. Expenditures for private nonfarm residential building, 1889–1921.

Source: Robert E. Lipsey and Doris Preston, *Source Book of Statistics Relating to Construction*, National Bureau of Economic Research (NBER), New York, 1966, pp. 35–38 (copyright).

New housekeeping units data, series N 62–63, are from David M. Blank, *The Volume of Residential Construction, 1889–1950*, Technical Paper 9, NBER, 1954, table 18. Blank's estimates were intended primarily to extend the official current dollar series (see series N 4), which begins in 1915, to earlier years. Blank presented his data for 1915–1920 as an improvement over the official series, and accepted the official series beginning 1921. Although Blank's estimating procedure was, in general, the same as that used for series N 4, more comprehensive source material and more refined techniques were used for the Blank estimates.

Blank estimated the permit value of new construction from Bureau of Labor Statistics-Works Progress Administration permit data by the same methods used in the Bureau of the Census *Construction Reports* (C 20), except that the calculation for all nonfarm housing units had to take account of the fact that rural nonfarm units had lower average values than urban nonfarm units. The permit valuations were then increased to allow for undervaluation of construction costs and to cover architects' and engineers' fees, land development costs, and builders' profit margins on construction operations. They were then converted to a construction-put-in-place basis, by extending the carryover of construction from one year to the next.

The constant dollar series was derived by deflating the current dollar data by a construction cost index developed by Blank. The index for 1910–1921 is based on the Boeckh index of residential construction. Earlier years are extrapolated by indexes of building-trade wage rates and building materials prices.

Data for additions and alterations to housekeeping units, series N 64–65, are from Leo Grebler, David M. Blank, and Louis Winnick, *Capital Formation in Residential Real Estate: Trends and Prospects*, NBER, 1956, pp. 40–52, 336, and 362. Additions and alterations are defined as in the Commerce series (see series N 61). Official Commerce estimates were carried back from 1921 by a crude graphic extrapolation using the movement of housekeeping construction expenditures but reducing the amplitude of fluctuation.

N 66–69. Value of new public construction put in place, by ownership and source of funds, 1915–1970.

Source: 1915–1946 (comparable with earlier years), U.S. Departments of Labor and Commerce, "Construction Volume and Costs, 1915–1946," statistical supplement to *Construction Review*, 1958, p. 10; 1946 (comparable with later years), U.S. Business and Defense Services Administration, "Construction Statistics, 1915–1964," supplement to *Construction Review*, January 1966, p. 14, and unpublished data; 1963–1970, U.S. Bureau of the Census, *Construction Reports*, series C 30, and unpublished data.

The sources also present detailed data by types of public construction. For bases of estimates, see text for series N 20–29.

N 70–77. Expenditures for new construction, private residential and nonresidential and public, in current and constant (1929) dollars, 1869–1955.

Source: Robert E. Lipsey and Doris Preston, *Source Book of Statistics Relating to Construction*, National Bureau of Economic Research (NBER), New York, 1966, pp. 29–32, 35–36, and 39–40 (copyright).

These series are a selection from the large number of annual estimates, partly unpublished, which underlie the five-year moving averages published with explanatory notes in Simon Kuznets, *Capital in the American Economy: Its Formation and Financing*, Princeton University Press for NBER, 1961.

N 70–71, total new construction. Kuznets' current price figures for 1952–1955 are U.S. Department of Commerce estimates of "Total New Construction Activity" plus "Petroleum and Natural Gas Well Drilling" from the *Survey of Current Business*, July 1956, table 31, p. 22. The constant (1929) price estimates for 1953–1955 were calculated, for private construction, from the current price estimates and an implicit price index derived from current and constant dollar figures in the *Economic Report of the President*, January 1956, pp. 165 and 168, and for public construction, by extrapolating the 1952 estimate by the constant price series in *Construction Review*, October 1956, p. 18.

For earlier years, Kuznets calculated total gross construction as the sum of (1) cost of oil and gas wells drilled and (2) all other construction.

The cost of oil and gas wells drilled in current prices was obtained as follows: For 1889–1928, the Kuznets' data were calculated by multiplying the series in 1929 prices by the price index for petroleum pipe lines. For 1915–1928, this price index was calculated from Business and Defense Services Administration (BDSA), *Construction and Building Materials, Statistical Supplement*, May 1954, pp. 33 and 82; it was extrapolated back from 1915 by the total construction cost index described in Kuznets, *National Product Since 1869*, NBER, 1946, table IV-4. For 1929–1938, this index was calculated from Office of Business Economics (OBE), *National Income*, 1954 edition, p. 209; 1939–1945, from BDSA, *Construction and Building Materials . . .*, p. 56; and 1946–1955, from OBE, *U.S. Income and Output*, 1958. The Commerce Department (BDSA and OBE) estimates represent all costs of drilling, including the cost of casings. The cost of installed production equipment, such as flowing and pumping equipment, is excluded. The figures are based on the cost of drilling oil and gas wells, as reported in the Census of Mineral Industries, 1939 and 1958, interpolated and extrapolated by annual data on the number of wells completed and on average cost per well.

The calculations for "all other construction" in current prices were as follows: 1889–1918: Calculated by multiplying the series in 1929 prices by the underlying price index. The latter was computed for 1915 and later years from *Construction and Building Materials . . .*, pp. 33 and 82, and was extrapolated from 1915 by the total construction cost index described in Kuznets, *National Product . . .*, table IV-4, notes to line 1. 1919–1951: Sum of (a) new private nonfarm residential construction including additions and alterations and excluding nonhousekeeping, from Grebler, Blank, and Winnick, *Capital Formation . . .* (cited in text for series N 62–65), appendix B, table B-6, and (b) all other new construction, from *Construction and Building Materials . . .*, tables 2 and 3.

The cost, in 1929 dollars, of oil and gas wells drilled was calculated as follows: Kuznets' data for 1889–1918 were extrapolated from the 1919 figure by the number of wells drilled each year (see pp. 526–527 of Kuznets, *Capital in the American Economy . . .*, for derivation). For 1919–1928, data were extrapolated from the 1929 figure by the series described in Kuznets, *National Income and Its Composition, 1919–1938*, NBER, 1941, p. 645. This series is based on individual State data for number of wells drilled and 1935 costs. For 1929–1945, Kuznets used the Commerce series in current prices divided

by the price index for petroleum pipelines, calculated from *Construction and Building Materials* . . . , pp. 33 and 82, and adjusted to a 1929 base. For 1946–1955, the sources used were the same as for the current price series.

The value of "all other construction" in 1929 dollars was calculated as follows: 1889–1914: Output of construction materials for domestic consumption, multiplied by 1.54056, the ratio of new construction to cost of construction materials consumed in 1919–1933. The method of estimation is described in Kuznets, *Capital in the American Economy*, table R-30, notes to column 10, and Kuznets, *National Product* . . . , table II-5, notes to column 7. For data on output of construction materials, see William H. Shaw, *Value of Commodity Output Since 1869*, NBER, 1947 (series D 7). 1915–1920: Sum of (1) new private nonfarm residential construction including additions and alterations, in Grebler, Blank, and Winnick, *Capital Formation* . . . , appendix B, table B-6, and (2) other new construction from *Construction and Building Materials* . . . , tables 15 and 16, adjusted to 1929 prices. 1921–1952: Given in *Construction and Building Materials* . . . , tables 15 and 16, adjusted to 1929 prices.

N 72–73, private nonfarm residential building. Gross private nonfarm residential construction is composed of housekeeping residential construction plus additions and alterations.

Current dollar figures were taken from the following sources: 1889–1920: New construction, from David M. Blank, *The Volume of Residential Construction 1889–1950*, table 18, plus a rough estimate of additions and alterations from Leo Grebler, David M. Blank, and Louis Winnick, *Capital Formation* . . . , table D-2, p. 363. The new construction series was built up originally from the BLS-WPA building permit surveys (see Blank, *The Volume of Residential Construction*, p. 33). Blank estimated the permit value of construction started and the total cost of construction started. He then converted construction started to construction put in place, by using an estimate of the average carryover into the following year of construction started in a given year (*ibid.*, pp. 52–56). 1921–1952: BLS-Commerce estimates published in *Construction and Building Materials* . . . , p. 6, and *Survey of Current Business*, July 1956, table 31.

The constant (1929) dollar figures were calculated as follows: The series in current prices was deflated by residential construction cost indexes. For 1889–1952, the index in Grebler, Blank, and Winnick, *Capital Formation* . . . , table B-10, column 1, was used. This is the Boeckh residential construction cost index extrapolated back from 1910 by building-trade wage rates and building material prices. The index for 1953–55 was the index implicit in the series for all private residential nonfarm building (including nonhousekeeping) in 1947–49 prices, *Construction Review*, September 1956.

N 74–75, private nonresidential construction. These series were calculated as a residual by subtracting from Kuznets' *Capital in the American Economy* total new construction series, C 1 and C 2 (here identified as series N 70–71), his series on gross private nonfarm residential building, C 3 and C 4 (series N 72–73), gross nonmilitary public construction, C 7 and C 8 (series N 76–77), and gross military construction (an earlier version of BLS-Commerce series C 55 and C 56); see source.

N 76–77, public construction. Current dollar figures were taken from the following sources: 1889–1914: Sum of separate estimates for Federal, State, and local governments. The Federal Government series are derived mainly from those published in U.S. Bureau of the Census, *Historical Statistics of the United States, 1789–1945*, 1949, and the State and local government series are derived mainly from the Census Bureau's publications on government finances. A detailed description is given in Kuznets, *Capital* . . . , notes to table R-30, pp. 580–584. 1915–1955: BLS-Commerce estimates published in *Construction and Building Materials* . . . , table 3 ("total public construction" minus "military facilities"), and *Survey of Current Business*, July 1956, table 31.

The constant (1929) dollar figures were taken from the following sources: 1889–1914: The components of the current price series were converted to 1929 prices by separate price indexes, each derived by extrapolating that implicit in the estimate for 1915 by the cost of construction index described in *National Product* . . . , table IV-4, notes to line 1. (See Kuznets, *Capital* . . . , table R-30 notes for further detail.) 1915–1955: BLS-Commerce estimates, from *Construction and Building Materials* . . . , table 16, adjusted to a 1929 price base, and extrapolated from 1952 to 1955 by the series in 1947–49 prices given in *Construction Review*, September 1956, table 4, p. 11.

N 78–100. Construction contracts awarded (Dodge)—value, and floor space of buildings, by class of construction, 1901–1970.

Source: 1901–1924, Robert E. Lipsey and Doris Preston, *Source Book of Statistics Relating to Construction*, National Bureau of Economic Research, New York, 1966, pp. 15–21 (copyright); 1925–1970, F. W. Dodge Division, McGraw-Hill Information Systems Company, New York (propriety data provided by special permission).

These series, except the part of residential buildings comprising privately owned one- and two-family houses, are based upon daily reports by the F. W. Dodge field staff. This field staff contacts owners, architects, engineers, contractors, financial institutions, real estate brokers, and others able to supply reliable information on construction projects. The series include new construction, additions, and major alterations within 60 days of work start. They exclude maintenance and repair work, farm building, ship building, and a part of force-account work done by firms and public agencies.

Geographic coverage has been increased in several steps since the series began. The earliest data beginning 1901 cover total construction in the New England States. Data covering 27 northeastern States and the District of Columbia are available from 1910; the addition of nine southern States between 1920 to 1923 brought the total to 36. Texas was added in 1924. The 37 States covered then excluded Montana, Idaho, Wyoming, Colorado, New Mexico, Arizona, Utah, Nevada, Washington, Oregon, and California. For the remaining 11 western States, information gathered from permit places, publications, and a sample of areas was used. From 1956 to 1969, the 48 conterminous States were covered; beginning 1970, all 50 States.

Valuation represents, as nearly as possible, actual construction costs, including subcontracts for such items as plumbing, heating, electrical work, roofing, and normal connecting utilities, and excluding land and architects' fees. Cost of industrial equipment not an integral part of the structure is excluded, except for special purpose equipment in petroleum refineries; outdoor chemical plants; electrical generating, power, and heating plants; and water and sewage treatment plants.

Floor space figures represent footage under roof, exclusive of basement. Where building permit data are the basis of the statistics, floor area is estimated from construction costs, with local building cost differentials applied to nationally established cost-per-square-foot rates.

N 101–110. Construction bidding volume (Engineering News-Record), by type, 1913–1970.

Source: *Engineering News-Record*, McGraw-Hill Inc., New York, various issues (copyright).

Data are based on daily reports by a field staff in 50 States and the District of Columbia. For 1963 to 1970, they consist of low bids for public construction and contract awards for private construction. Excluded are homebuilding, design-and-construct contracts (under which the contractor is responsible for design as well as the construction) and projects of investment builders or owner-builders serving as their own general contractors. They thus exclude a large proportion of chemical process and powerplant (design-and-construct) contracts and substantial volumes of commercial and apartment projects handled by owner-builders. Beginning 1963, data cover only projects reported by *Engineering News-Record* as new plans and which have advanced to the low bid or contract award stage. Al-

though data prior to 1963, which are contract awards, are not strictly comparable with later data, the earlier and later figures are adequately comparable in coverage to describe long-term trends consistently for the separate series. In the aggregate they represent over 65 percent of the annual volume reported by series N 78–89. The following types of construction are included: Water supply, sewers and waste disposal, bridges, streets and roads, earthwork and waterways, public buildings, multiunit residential structures, commercial building, industrial plants, and an unclassified category. Only larger projects are included, and the minimum cost of projects covered by the reports has varied over time. For 1963 to 1970, the minimum cost of projects covered was: $100,000 for public works other than buildings, industrial and unclassified; $500,000 for buildings other than industrial. Because of the emphasis on heavy engineering works and the difference in geographic coverage, as well as other reasons, the data are not comparable to series N 78–89.

N 111–117. General note.

While comprehensive estimates of construction expenditures by types of construction, such as presented in series N 1–29, are generally preferred for most purposes, building permit data are available for a considerably longer period. Permit values are based on estimates by builders of the costs of building for which permits are granted or plans filed. Permit data generally cover private, rather than public, construction; building, rather than nonbuilding, types of construction; and are generally limited to construction within the corporate limits of the cities covered. On the average, the cost of the projects covered is underestimated; small projects are generally not covered at all. Permit data are less frequently available for smaller cities and for earlier years. It follows that building permit data in unadjusted form are unsatisfactory as measures of the total absolute volume of new construction. Permit data are often more satisfactory when used in the form of relatives or indexes of permit values, as in the case of series N 111–114.

Although the absolute amount of construction activity is not adequately indicated by early permit data, the data clearly indicate the presence and approximate timing of cycles in private building. However, the relatively few cities upon which permit indexes are based during the earlier years suggests caution in the drawing of quantitative conclusions, particularly as to the amplitude of building cycles. Nonbuilding construction of various types and public building construction have fluctuated somewhat differently from building permit indexes, so that the data available for the analysis of cycles in total new construction over an extended period of years are particularly inadequate. The mere comparison of the various series on building permits purporting to measure roughly the same type of activity should warn the user against placing too much confidence in the data.

N 111. Index of new building permit values (Long), 1868–1939.

Source: Clarence D. Long, Jr., *Building Cycles and the Theory of Investment*, Princeton University Press, 1940, pp. 213–223 (copyright).

This index was obtained by averaging the monthly indexes given in the source. The number of cities covered by the index has ranged from 1 to 37 (or 33 if all the boroughs of New York City are combined). For a list of cities and years covered, see source. The aggregate permit volume each year was divided by the aggregate volume for the same cities in 1930. For additional explanation, see general note for series N 111–117.

N 112–113. Index of new building permit values (Newman), 1875–1933.

Source: William H. Newman, "The Building Industry and Business Cycles," *The Journal of Business of the University of Chicago*, vol. VIII, No. 3, pp. 63–71, copyright, University of Chicago.

These are annual indexes and annual averages of monthly indexes. Series N 112 is based on Bradstreet's building permit values, 120 identical cities, 1911–1933; Babson's monthly values of building permits in 20 cities, 1903–1910; Ayres' permits in 50 cities, 1900–1902; and permit data from 13 cities, 1875–1900. Series N 113 is obtained from series N 112 by the use of the following building cost indexes: The American Appraisal Co.'s building construction cost index, 1913–1933; an arithmetic average of the American Appraisal Co.'s cost indexes for frame, brick, and reinforced concrete buildings, 1900–1913; and an average of the frame- and the brick-building cost indexes, 1875–1900. For additional explanation, see general note for series N 111–117.

N 114. Index of new building permit values (Riggleman-Isard), 1830–1933.

Source: Miles L. Colean and Robinson Newcomb, *Stabilizing Construction: The Record and Potential*, McGraw-Hill, Inc., New York, 1952, appendix N, table 2 (copyright).

This index is based on the per capita value of building permits as estimated in an unpublished doctoral dissertation by John R. Riggleman, *Variations in Building Activity in United States Cities*, Johns Hopkins University, 1934. The data cover Manhattan, Boston, and Washington, D.C., from 1830 through 1848. The coverage then increases gradually to a total of 10 cities in 1868, which were augmented to cover 70 cities in 1900 and subsequent years (counting the 5 boroughs of New York City separately). For the cities covered, see the source, appendix N, table 4, footnote c, p. 240. By eliminating the population adjustment and weighting the data on the basis of the relative volume of activity from 1920 to 1929 in the areas covered, Isard developed a series more comparable to that of Long (series N 111) in general movement (see Walter Isard, *The Economic Dynamics of Transport Technology*, unpublished doctoral dissertation, Yale University, 1947). The data back to 1830 have decreasing credibility.

N 115. Index of dollar volume of new construction (Newcomb), 1868–1914.

Source: See source for series N 114, appendix N, table 3.

This index is based on a 3-year moving average of the figures for series N 114 for 1868–1878, and on a 3-year moving average of the figures for series N 111 for 1879–1914, adjusted by (1) weighting residential building at one-third instead of approximately one-half used by Long, series N 111, and (2) changing the base to 1920–29 = 100. The purpose of these adjustments by Robinson Newcomb of the original series is to make their year-to-year movement more closely comparable to that of construction expenditures which fluctuate less than building permits, and to reduce the weight of residential construction for early years to that found in the official estimates of construction expenditures beginning in 1915, series N 1–29. Newcomb notes that the index figures for 1868–1914 are suggestive only, since the raw data are not sufficient for a reliable index. The source extends the index to 1951 by using the official estimates of construction expenditures, series N 1–29.

N 116–117. Index of urban dwelling units (Blank), 1870–1929.

Source: David M. Blank, *The Volume of Residential Construction, 1889–1950*, National Bureau of Economic Research, New York, Technical Paper 9, 1954, table 11 (copyright).

This index is based on building permit data covering Manhattan for 1870–1874 and gradually augmented to cover 67 cities in 1900 and 314 in 1929. For list of cities and years covered, see source, table 23. This is a chain index computed by first deriving relatives of the aggregate number of dwelling units authorized and the aggregate permit valuation of such units in identical cities in the sample between pairs of successive years. The data are unadjusted for

lapses of building permits (with certain exceptions for New York City) and for understatement of valuations in building permits. The valuations are not converted to a work-put-in-place basis to reflect construction expenditures.

N 118–137. Construction cost indexes, 1913–1970.

Source: U.S. Bureau of the Census. 1915–1968, unpublished data. The indexes for **series N 132,** 1915–1968, **series N 133–134,** 1946–1968, **series N 135,** 1962–1968, and **series N 136,** 1967 and 1968, were provided on a 1967 base by the source agencies; all other indexes, except series N 137, represent conversions of those given on a 1957–59 base in U.S. Business and Defense Services Administration, *Construction Statistics, 1915–1964,* pp. 58 and 59, and in Bureau of the Census, *Construction Reports,* series C 30, various issues. 1969 and 1970, *Construction Reports,* series C 30-74-7, p. 8. **Series N 137,** see source for series N 114, appendix Q.

Construction cost indexes are useful in the conversion of construction expenditure data from current prices to constant prices and in the study of cost trends. However, no single cost index is satisfactory for all types of construction since the movements of cost differ for different types of construction. Series N 118, however, is a composite index weighted by the relative importance of the major classes of construction.

Construction cost indexes generally are not fully adequate for the making of cost comparisons over an extended period of time. Changes in the productivity and the proportions used of the various productive factors cannot be allowed for easily in the assignment of weights to labor, materials, and other cost items. An aggregative index proportional to the total construction cost of a standardized project, or a component part thereof, is not easily computed for most types of construction and suffers from the disadvantage of the probable eventual obsoleteness of any adequately specified standard project. For further discussion, see chapter IV of source cited above for series N 137; Lowell J. Chawner, "Construction Cost Indexes as Influenced by Technological Changes and Other Factors," *Journal of the American Statistical Association,* 1935, vol. 30, pp. 561–576; and Leo Grebler, David M. Blank, and Louis Winnick, *Capital Formation in Residential Real Estate,* Princeton University Press, 1956, appendix C.

N 118, Department of Commerce composite cost index. This index is a combination of various indexes weighted by the relative importance of the major classes of construction. It is an implicit index computed by dividing the total estimate of new construction activity in current prices by the total expressed in 1967 prices. Since the total in 1967 prices is obtained by adding the estimates for the separately deflated classes of construction, the composite cost index is the equivalent of a variably weighted index, reflecting changes not only in the component indexes, but also in the relative importance of the major classes of construction which are used as weights. For 1945–1970, the index is an average of the 12 monthly indexes.

N 119, American Appraisal Company index. This index is compiled on the basis of a detailed bill of quantities of material and labor required for four representative types of buildings—frame, brick, concrete, and steel—with allowances for contractor's overhead and profit, in various cities throughout the United States. Workmen's compensation and liability insurance, unemployment insurance, and old-age pension factors are included. The index covers the structural portion of the buildings, but does not include the fixtures such as plumbing, heating, lighting, sprinkler systems, and elevators. The material and labor costs are recomputed monthly in accordance with average prices and wages supplemented by personal investigation of appraisers and information from clients and others as to actual costs. These computations automatically result in weighted averages for the individual buildings. Arithmetic averages are computed for the individual buildings and cities to obtain the city and national averages. The latter covers 24 cities prior to 1925 and 30 cities since that time. The index reflects changes in average price levels but does not reflect costs resulting from overtime wages and bonuses during boom periods or sacrifice prices and omissions of overhead costs and profits during depression periods.

N 120, Associated General Contractors index. This index is a combination of indexes of wages and materials weighted in the proportion of 40 percent for wages and 60 percent for materials. Wages used in computing this index are for hod carriers and common laborers, and the material prices are those for sand, gravel, crushed stone, portland cement, common brick, lumber (each with a weight of one), hollow tile (weighted ½), and structural and reinforcing steel (each with a weight of ¼). Wages and prices are reported by the 12 district offices of the Association as of the 15th of each month.

N 121–123, E. H. Boeckh and Associates indexes. These indexes are based on separate computations for 10 types of buildings in 20 cities (comparable indexes are available from the compilers for a total of more than 40 cities). The basic list of items covered includes current local prices for common brick, common lumber, portland cement, structural steel, common labor, brickmasons, carpenters, structural ironworkers, plasterers, and miscellaneous which includes many specialized items such as heating and plumbing equipment, paint, glass, and hardware. Wage rates are adjusted to reflect efficiency of local labor. State and local sales taxes and Social Security payroll taxes are included. The weights assigned to the different items vary among the 10 types of buildings. An unweighted arithmetic average of the individual indexes for the 20 cities for each of the 10 types of buildings has been computed and these have been further consolidated into the 3 series shown here. The residential index is an unweighted average of the indexes for frame residences and for brick residences; the apartment, hotel, and office building index is an unweighted average of the indexes for brick and wood, brick and concrete, and brick and steel apartment, hotel, and office buildings; the commercial and factory buildings index is an unweighted average of the indexes for wood, steel, brick and wood, brick and steel, and brick and concrete commercial and factory buildings.

N 124–125, Engineering News-Record indexes. The index of construction costs is comprised of (1) steel, which until 1938 was the base price of structural steel shapes at Pittsburgh and, beginning in 1938, is a weighted average of steel prices at Pittsburgh, Gary, and Birmingham; (2) cement, which until 1948 was the consumers' net price, f.o.b. Chicago, and, beginning in 1948, is the ENR 20-city average of bulk cement prices; (3) lumber, which until 1936 was 12 x 12 long leaf yellow pine, wholesale, at New York, and beginning in 1936 is a composite 20-city price average of 2 x 4 Douglas fir and southern or local pine in carload lots; and (4) common labor rate paid in the steel industry for 1913–1920 and since 1920 the average common labor rate in construction (ENR 20-city average of wage rates in force). The 4 components are weighted according to their relative importance in the national economy in 1910, 1913, 1916, and 1919. The index of building costs is identical to the index of construction costs for all components except wage rates, where the trend of skilled labor wage rates is substituted for common labor wage rates. For a detailed description of these two indexes, see U.S. Office of Business Economics, *Business Statistics,* 1971 edition, p. 53.

N 126–127, Economic Research Service farm construction cost indexes for farm housing and other farm construction. This is a weighted index of farm wage rates and prices paid for materials. In compiling the index of farm housing construction costs, prices paid by farmers for building materials are given a weight of 73 percent, farm wage rates a weight of 27 percent. For other farm building construction, the corresponding weights are 78 and 22 percent. The wages paid by farmers for labor for building construction and repairs are higher than the wages paid for ordinary agricultural labor, but they probably fluctuate more comparably to farm labor wage rates than to urban union wage rates.

N 128, George A. Fuller Company index. This is a composite index of 36 major cost elements, in 3 commercial type buildings, including structural elements, elevators, wiring, heating, plumbing, ventilating, and employee benefit costs. The index is adjusted for

changes in productivity from job-cost reports showing the number of man-hours of skilled and unskilled labor required. The indexes are simple averages of the quarterly indexes from the job-cost reports made by the compiler.

N 129–131, Handy-Whitman public utility construction cost indexes (compiled by Whitman, Requardt and Associates, Baltimore). These indexes measure changes in construction costs of utility buildings, gas plants, and electric plants. Cost trends of reinforced concrete utility building construction and brick utility building construction are reported semiannually by geographic regions. A single index is computed by averaging the figures for the first, middle, and end of each year for each region and then combining the regions for a United States average. Cost trends of gas plant construction and of steam-operated electric plant construction are also reported semiannually by geographic regions. A single index for each is computed in the same manner as for utility buildings.

N 132, Interstate Commerce Commission railroad construction cost index. The index is the weighted average for the entire United States of 31 separate indexes for individual operations important in railroad construction. Separate indexes covering items such as grading, tunnel excavation, bridges, ballast haul, and tracklaying and surfacing, were developed largely from analysis of major construction contracts covering a period of more than 30 years. The indexes for materials accounts—such as ties, rails, other track material, ballast, and fences—were based on studies of carriers' returns, joint studies made with the various railroad committees, well-known engineering and trade publications, contracts covering major construction projects over a period of 30 years, and other information furnished by individual carriers.

N 133–134, Bell System Telephone plant indexes. The American Telephone and Telegraph Company compiles separate annual cost indexes for construction of telephone company "buildings" and "outside plant," e.g. poles, cable, aerial wire, and underground conduits. These indexes represent changes in the total installed cost of telephone buildings or plant. The "outside plant" index reflects the effect of price changes in the cost of telephone apparatus and the cost of associated installation and engineering.

N 135, Federal Highway Administration index. This index is based upon a record of quarterly variations in contract unit bid prices maintained by the Federal Highway Administration and its predecessor, Public Roads Administration, since 1922. Cost indexes are based on average annual construction on State and Federal aid highway systems during 1925–1929. Average costs for these years are taken as 100 percent. For this period, the total quantity and contract cost of each of the principal cost-controlling contract items were summarized and divided by the total mileage of construction. This operation provided average quantities of each type of work involved per average gross or composite mile of construction. Since unit prices and construction volumes vary not only from State to State but also from year to year, the percentage of each item contributed during this 5-year period by each State was adopted as the contributing State base. The index thus indicates the relative costs at which the average quantities placed per mile in 1925–1929, with the same State distribution, could be replaced at current contract bid prices. Figures for 1915–1922 were extrapolated by the Department of Commerce by means of a weighted average of the Interstate Commerce Commission indexes for grading; tunnel and subway excavation; bridges, culverts, and trestles; and ballast. This index is a composite derived from average unit bid prices for fixed amounts of the following items put in place: Common excavation, surfacing, and structures. The base quantities involved in measuring this index are: 3,641,885,000 cubic yards of roadway excavation; 154,953,000 square yards of portland cement concrete surfacing with average thickness of 9.1 inches; 111,516,000 tons of bituminous concrete surfacing; 2,206,879,000 pounds of reinforcing steel for structures; 2,581,462,000 pounds of structural steel; and 14,583,000 cubic yards of structural concrete.

N 136, Turner Construction Company index. This index is based on the building cost experience of the Turner Construction Company in eastern cities applied to these factors: Labor rates, material prices, productivity of labor, efficiency of plant and management, and competitive conditions. The series also reflects the payment of sales taxes and employee benefit costs.

N 137, average of contractor indexes of construction cost. This is an average of 4 contractor indexes shown separately in the source. In contrast to the common indexes of construction costs, which usually represent a combination of wages and materials prices according to a fixed relationship and may not take adequate account of changes in efficiency, the contractor indexes are based on estimates of the actual cost for erecting comparable structures. The comparison of these indexes with the common indexes may suggest changes in cost that result from changes in efficiency. For a fuller discussion, see the source, pp. 69–74, and Grebler-Blank-Winnick, appendix C.

N 138. Building cost index (Riggleman), 1868–1933.

Source: See source for series N 114, appendix N, table 4.

The index is from an unpublished doctoral dissertation by John R. Riggleman, *Variations in Building Activity in United States Cities*, Johns Hopkins University, 1934, appendix I. The index was constructed on the basis of several sources, including the American Appraisal Company's cost of industrial buildings in eastern cities to 1903 and the *Engineering News-Record* construction cost index for 1904–1933. The figures for earlier years are less reliable than those for later years, and should be used with caution. The source also presents the index back to 1830.

N 139. Residential construction cost index (Blank), 1889–1933.

Source: David M. Blank, *The Volume of Residential Construction, 1889-1950,* National Bureau of Economic Research, New York, Technical Paper 9, 1954, table 21 (copyright).

For 1889–1914, the index is based on weighted averages of building trade wages and building materials prices, more fully described in the source. For 1915–1933, the index is the Boeckh residential construction cost index shown as series N 121, converted to the 1929 base. The figures for earlier years are less reliable than those for later years and should be used with caution.

N 140–155. Indexes of wholesale prices for construction materials, 1926–1970.

Source: U.S. Bureau of Labor Statistics, *Handbook of Labor Statistics, 1973,* pp. 315–318, and *Wholesale Prices and Price Indexes,* monthly and annual issues.

Data cover materials incorporated as integral part of a building or normally installed during construction and not readily removable. Excluded are consumer durables, such as kitchen ranges, refrigerators, etc.

For compilation and description of wholesale indexes, see series E 23-122.

* Denotes first year for which figures include Alaska and Hawaii, except that the nonfarm component of series N 4 should be interpreted as including estimates for Alaska and Hawaii beginning 1946.

NA Not available.

[1] Public industrial and commercial building not segregable from private construction, 1915–1932; amount believed negligible.

[2] Beginning 1946, figures not entirely comparable with those for earlier years.

[3] Prior to 1960, excludes farm housing.

[4] Excludes building by privately owned public utilities. Beginning 1968, figures not comparable with earlier years because of revision in survey.

[5] Prior to 1959, includes local transit; thereafter, local transit included in "All other private."

[6] Excludes farm.

[7] Includes farm housing units.

[8] Comparable with later years.

[9] Comparable with earlier years. Source: U.S. Department of Commerce and U.S. Department of Labor, *Construction Volume and Costs, 1915–1956*, a statistical supplement to *Construction Review*, pp. 2–9.

[10] Includes construction with Rural Electrification Administration funds.

[11] Includes sewer and water systems, roads, bridges, and miscellaneous nonstructural items such as parks and playgrounds. Beginning 1959, includes local transit.

[12] Includes publicly owned parks and playgrounds, memorials, etc.

Series N 30–60. Value of New Private and Public Construction Put in Place, 1957–59 Dollars: 1915 to 1970

[**In millions of dollars.** Beginning 1960, figures for these series are essentially comparable with figures for series N 1–29, *except* series N 33 with N 4, new private residential units; series N 36–39 with N 7–10, new private nonresidential buildings; series N 40 with N 11, new farm nonresidential; and series N 41–46 with N 12–17, new privately-owned public utilities. See text for series N 1–29 and general note for series N 1–60]

Year	Total new construction	Private construction

* Denotes first year for which figures include Alaska and Hawaii, except that the nonfarm component of series N 33 should be interpreted as including estimates for Alaska and Hawaii beginning 1946.

[1] Public industrial and commercial building not segregable from private construction, 1915–1932; amount believed negligible.

[2] Excludes farm housing.

[3] Excludes building by privately owned public utilities.

[4] Includes local transit.

[5] Includes farm housing.

Series N 61. Construction Expenditures for Maintenance and Repair: 1915 to 1963

[In millions of dollars. Includes work relief expenditures, 1933–1943. Beginning 1950, figures not entirely comparable with those for earlier years]

* Denotes first year for which figures include Alaska and Hawaii.

[1] Construction programs receiving Federal grant-in-aid funds cover highways, schools, hospitals, airports, and miscellaneous community facilities.

[2] Comparable with later years.

[3] Comparable with earlier years.

Series N 70–77. Expenditures for New Construction, Private Residential and Nonresidential and Public, in Current and Constant (1929) Dollars: 1869 to 1955

[In millions of dollars]

1869–1878 [4]	802	1,671						

[1] Includes oil and gas well drilling.
[2] Total housekeeping, including additions and alterations.
[3] Excludes military.
[4] Annual averages per year for overlapping decades.

Series N 78–89. Value of Construction Contracts Awarded (Dodge), by Class of Construction: 1901 to 1970

[In millions of dollars. Includes new structures and alterations to existing structures. Figures for 1901–1909 are for New England States only; 1910–1922, for 27 States except as noted; 1923–1924, for 36 States; 1925–1955, for 37 States; 1956–1969, for 48 States; thereafter, for 50 States. See text]

* Denotes first year for which figures include Alaska and Hawaii.

[1] Includes contracts awarded for atomic energy plants as follows (in millions): 1949, $247; 1950, $2,020; 1951, $123; 1952, $2,829; 1953, $72; 1954, $19; 1955, $131; 1956, $86; 1957, $64; 1958, $84; 1959, $241; 1960, $59; 1961, $82; 1962, $106.

[2] Deduct $400 million for cost savings on Portsmouth, Ohio, atomic energy plant originally estimated to cost $1.2 billion.

[3] Add $1,357 million for atomic bomb plants.

[4] $1,800 million canceled by War Production Board.

Series N 111–117. Indexes of Building Activity: 1830 to 1939

Chapter N

Housing (Series N 156-307)

N 156–169. New housing units started, by ownership, type of structure, location, and construction cost, 1889–1970.

Source: U.S. Bureau of the Census, 1889–1962, *Housing Construction Statistics, 1889 to 1964*, tables A-1 and A-5; 1963–1970, *Construction Reports*, Housing Starts, series C 20-73-7, July 1973.

The data for 1889–1919 are from David M. Blank, *The Volume of Residential Construction, 1889–1950*, Technical Paper No. 9, National Bureau of Economic Research, 1954; data for 1920–1929 are from David L. Wickens and Ray R. Foster, *Nonfarm Residential Construction, 1920–1936*, National Bureau of Economic Research, Bulletin No. 65, 1937. The data for 1930–1944 are from U.S. Department of Labor, *Construction, 1948 in Review*, Bulletin No. 983, 1950; data for 1930–1936 represent a revision by the Bureau of Labor Statistics of the Wickens-Foster data. Data for 1945–1970 are Census Bureau estimates derived from its monthly estimates based on building permits and supplemented by sample surveys of housing starts in nonpermit-issuing areas. Data for 1945–1958 are revisions of data from the Bureau of Labor Statistics; detail data, such as number of units by type of structure, are not available for these years.

For methods used by Blank and Wickens-Foster, see the sources. Blank's data are based on a comprehensive tabulation of historical building permit data collected by the Works Progress Administration and made available by the Bureau of Labor Statistics (BLS). For methods used by BLS, see BLS Bulletin No. 1168, *Techniques of Preparing Major BLS Statistical Series*, December 1954, chapter 2.

Basically, compilation of the housing starts series depends on four steps. First, an estimate is made of the number of housing units for which building permits have been issued in all permit-issuing places each month. For the country as a whole, about 85 percent of the private housing units were constructed in permit-issuing places in recent years. Since 1967, the series have pertained to approximately 13,000 places identified in 1967 as having local building permit systems. Coverage from 1963 to 1967 was based on a permit-issuing universe of 12,000 places, identified as permit-issuing in 1962. Back to 1959, the series relate to the 10,000 places identified as permit-issuing in 1959. Prior to 1959, 6,600 places was the universe. Second, a survey is made each month in a sample of permit places. In each place, a sample of building permits is selected each month and an inquiry is made of the owner or the builder to find out whether and when the units covered by the permits have been started. From this sample of permits, ratios are calculated, by type of structure, of the number of units started to the number of units covered by permits. These ratios are then applied to the total number of units authorized by permits in the corresponding months to provide estimates of the total number of units started each month with permit authorization. Third, the estimates of the number of one-family units started in each month with permit authorization are adjusted upward by 3.3 percent to take care of the units started within permit-issuing areas but without permit authorization. The fourth step in estimating total housing starts is to estimate the number of units started in areas where building permit systems do not exist. In a sample of 100 areas, visits are made to a select group of persons who are presumed most likely to know about local housing activities. A list is obtained from them of all residential buildings they know to have been started within the nonpermit portions of these areas during the preceding month. Within those portions of the sample area, a subsample of areas is canvassed for all units started since the previous month, identifying those not reported by the sources as well as those reported by them. This canvass provides a basis for estimating the number of units not reported by the local sources. The number of units not reported is then added to the number of units reported, to provide an estimate of total housing starts in areas not covered by building permit systems.

The housing units covered in these series are permanent housekeeping units in new residential structures. Excluded are temporary units; accommodations without housekeeping facilities such as transient hotels, dormitories, and clubhouses; mobile homes, trailers, houseboats, sheds, and shacks used for housing purposes; units provided by conversion of existing structures; and housing units in nonresidential structures such as factories, warehouses, or public buildings.

For regional estimates of the number of new private nonfarm housing units started, 1920–1950, see Leo Grebler, David M. Blank, and Louis Winnick, *Capital Formation in Residential Real Estate: Trends and Prospects*, Princeton University Press, 1956, table H-1. Regional estimates for later years appear in Bureau of the Census, *Construction Reports*, series C 20.

N 157–158, new housing units started, by ownership. For bases of estimates for privately financed housing units, see text for series N 156–169. Publicly owned housing includes housing units in buildings for which construction contracts were awarded by Federal, State, or local governments. Information on public housing is obtained, for the most part, from the agencies involved, e.g., Department of Housing and Urban Development, Department of Defense, New York City Housing Authority, and others. The criterion for classifying housing units as public is ownership of the facilities rather than the source of funds. Thus, low-rent housing projects owned by local housing authorities are classified as public even though they may be financed by local bonds issued to private investors, and military housing units owned by the Department of Defense are also classified as public even though they may be financed by mortgages held by private lending institutions. Figures exclude temporary dwellings built during the defense period and World War II (1940's), veterans temporary re-use housing (see text for series N 186–191), and temporary structures on military posts and similar installations. Units in structures built by private developers for sale upon completion to local public housing authorities under the Department of Housing and Urban Development "Turnkey" program are classified as private housing.

N 162–163, new housing units started, by location. The distribution of housing starts between units inside and outside standard metropolitan statistical areas (SMSA's) is based on the definitions published by the Office of Management and Budget in *Standard Metropolitan Statistical Areas*. Data for 1959–1960 are based on 1959 definitions; for 1961–1963 on 1961 definitions; for January 1964–March 1968 on 1964 definitions; and for April 1968–1970 on 1967 definitions. The term, "urban" was applied to all incorporated places with a population of 2,500 or more and to a relatively small number of areas urban under special rule. "Rural-nonfarm" housing included all housing (except farm housing) in unincorporated areas and in incorporated places of less than 2,500 inhabitants. This classification for 1920–1929 was based on the 1930 Census of Population and for 1930–1944 on the 1940 census. This classification system was abandoned in 1954 because of the difficulties of resolving differences between the geographic areas used for building permit systems and the urban areas as newly defined in the 1950 census. Beginning in 1950, housing starts have been classified by those inside and outside the standard metropolitan statistical areas.

N 164–169, construction cost. The construction cost data for the privately owned units are not reported directly but are based on permit valuations adjusted for understatement of construction cost

and relationship between costs in permit places and nonpermit areas. They cover the cost of labor, material, and subcontracted work, and that part of the builder's overhead and profit chargeable directly to the building of the housing units started. Included is the cost of equipment which becomes an integral part of the housing unit and is essential to its general use. Excluded are the costs of land, site improvement, architectural fees, and sales profit.

The data for the publicly owned units are based on contract award values or estimated construction costs for individual projects, as reported by the several agencies administering the various public housing programs.

The source, *Housing Construction Statistics, 1889 to 1964*, was designed as an historical supplement to the current data issued by the Bureau of the Census in three publication series of its Construction Reports program—*Housing Starts*, series C 20; *Building Permits, Housing Authorized in Individual Permit-Issuing Places*, series C 40; and *Building Permits, Housing Authorized in Permit-Issuing Places, Summary Statistics*, series C 42.

N 170. Mobile home shipments, 1947–1970.

Source: U.S. Department of Housing and Urban Development, *HUD Statistical Yearbook*, annual issues.

Statistics on manufacturers' shipments of mobile homes are provided by the Mobile Home Manufacturers' Association, and include estimates for firms not associated with the MHMA. Mass production of 10-foot wide homes began in 1955; 12-foot wide homes in 1962.

Manufacturers' shipments of mobile homes are included in this volume because an addition to the housing supply is made by mobile homes as well as by the construction of new housing units. Some of the mobile homes, however, are used as seasonal homes and second homes and do not add to the supply of housing units occupied as usual places of residence. Furthermore, some are used for nonresidential purposes. The number of mobile homes used in these ways is not now known.

N 171–179. New publicly owned housing starts, by ownership and program, 1949–1970.

Source: U.S. Bureau of Domestic Commerce, *Construction Review*, monthly issues.

These series, which are compiled by the U.S. Bureau of the Census, represent an actual count of publicly owned housing starts as reported by the Public Housing Administration (PHA), the Defense Department, the New York City Housing Authority, and other State and local housing authorities. Publicly owned housing units were not reported separately until 1935. It is considered that the volume of permanent publicly owned housing units prior to 1935 is insignificant. Housing provided under the Federal emergency programs, including those of World War II, consisted largely of units in temporary or converted structures and, therefore, are not included in the permanent units shown. Type of program data, i.e., Federal, State, or local, are not available for publicly owned housing prior to 1949.

N 180–185. Privately owned housing units in major Federal programs, 1935–1970.

Source: All series except N 181 and N 185, U.S. Housing and Home Finance Agency, 1935–1956, *Annual Report, 1956*, tables A-6, A-37, A-42, and A-54; 1957, *Annual Report, 1957*, tables A-7, A-48, A-53, and A-68; 1958–1963, *Annual Report, 1964*, table III-3; 1964–1970, U.S. Department of Housing and Urban Development, *1970 HUD Statistical Yearbook*, tables 146, 160, 162, and 164. **Series N 181 and N 185**, U.S. Veterans Administration, Loan Guaranty Service, unpublished data.

Figures are based on reports of the agencies administering the programs. The Federal Housing Administration (FHA) and the Veterans Administration (VA) are agencies which insure or guarantee loans made by private lenders.

N 180–181, new privately owned units started under FHA and VA. Data are based on monthly reports of these agencies. These reports are based on the first of several inspections of newly started units required by the agencies, the timing of which coincides roughly with the definition of housing starts by the Bureau of Labor Statistics and the Bureau of the Census.

The figures may be used roughly to derive the units started under FHA and VA as a percentage of all private housing starts. However, an unknown number of units started under FHA or VA inspection is sold later for cash or with conventional (uninsured or unguaranteed) mortgage loans. On the other hand, the number of units started under the FHA program understates the role of FHA inasmuch as previously unoccupied (new) houses, for which the builder did not apply for FHA insurance before construction, are classified by FHA as "existing construction" when the houses are sold later with FHA-insured loans. In 1956, about one-fifth of the FHA units classified as "existing construction" were previously unoccupied (new). However, by 1970, such previously unoccupied (new) units amounted to less than 3 percent of those classified under "existing construction." For problems of coverage and comparability, see Department of Commerce and Department of Labor, *Construction Review*, "FHA and VA Housing Statistics and the Housing Market," June 1957.

N 182–185, new and existing privately owned units covered by loans under FHA and VA. Data are based on monthly reports of these agencies and refer to loans on both new and existing construction at the time such loans were closed or actually insured. FHA "homes" include 1- to 4-family dwellings; FHA "rental projects" include structures having 5 or more dwelling units. Practically all VA loans are on single-family dwellings. The VA program was authorized in 1944 and the small 1944 activity is included in 1945.

N 186–191. Low-rent public housing units, by progress stage, and war and defense housing and veterans housing units available for occupancy, 1941–1970.

Source: U.S. Department of Housing and Urban Development, Housing and Mortgage Credit-FHA, *HUD Statistical Yearbook*, various issues.

These data comprise low-rent, publicly financed housing units occupied or available for occupancy, units to be constructed, and units that were to go directly under management since they needed no rehabilitation. The data are not comparable with series N 156–159 which relate to new construction starts and include all publicly financed units (Federal, State, and local).

N 192–195. Nonfarm dwelling units standing and selected components of change, 1890–1950.

Source: Leo Grebler, David M. Blank, and Louis Winnick, *Capital Formation in Residential Real Estate: Trends and Prospects*, Princeton University Press, 1956, tables 15 and A-1 (copyright, National Bureau of Economic Research, New York).

Estimates do not represent all components of change in the nonfarm housing inventory; that is, the units added through new construction or conversion minus the units destroyed through demolition or disaster losses during a certain period do not equal the net change in the inventory during the same period. This difference is due mainly to the following factors: (1) The net change in the nonfarm housing inventory reflects the reclassification of farm dwellings, as farmland is absorbed in suburban and urban development; (2) the inventory includes temporary dwelling units, shacks, trailers, and dwellings in nonresidential buildings such as factories or warehouses, which are not included in the estimates of housing starts; (3) the periods of the inventory estimates are not fully reconcilable with the calendar-year estimates of new or converted units and of demolitions; (4) minor changes in census definitions; and (5) deficiencies of estimates, particularly for conversions and demolitions. For a reconciliation of the net change in inventory and the various components

of change for 1930–1939, see Bureau of Labor Statistics, Serial No. R. 1421, "Housing and the Increase in Population," 1942. For a similar reconciliation for 1940–1949, see Grebler-Blank-Winnick (cited above), appendix A and appendix D, especially table D 4.

N 192, dwelling units standing. Estimates for 1890–1920 are based on David L. Wickens, *Residential Real Estate,* National Bureau of Economic Research, 1941, p. 55. The 1890 and 1900 estimates apply to June 1, the 1910 estimate to April 15, and the 1920 estimate to January 1. The data were derived by dividing Wickens' estimates of nonfarm private families (now termed households) by the occupancy ratios implicit in Wickens' vacancy estimates. The estimate for 1930 applies to April and is based on figures in the Bureau of Labor Statistics Bulletin cited above, p. 12. The 1940 and 1950 figures apply to April 1 and are from the *Sixteenth Census of the United States: 1940, Housing,* vol. II, part 1, p. 10, and *U.S. Census of Housing: 1950,* vol. I, p. 3.

N 193–194, units added during period. For certain periods, the number of "new units" shown for series N 193 varies from the estimated number of permanent dwelling units started as shown for series N 156. Only for 1890–1919 is there exact agreement as both series for this period are based on the same sources using the same concepts and definitions. A slight difference for 1920–1929 is due to varying estimates for the year 1920. The differences for later periods reflect mainly the factors outlined above under (2) and (5).

N 195, units demolished or destroyed during period. The 1940–1949 estimate is designated in the source as a "preliminary estimate by an interdepartmental committee of Federal agencies," but no revision of it was made thereafter.

N 196–199. Nonfarm residential wealth, 1889–1953.

Source: See Grebler-Blank-Winnick source for series N 192–195, table D-1, columns 1, 2, 4, and 5.

Estimates are for housekeeping dwellings, i.e., do not cover transient hotels, clubs, motels, dormitories, and similar facilities. For an alternative estimate of nonfarm residential wealth, see series F 422–469.

N 197–198, structures. The value of structures in 1929 dollars was obtained by adding to an estimate for the end of 1889 annual estimates of net capital formation in constant dollars (shown in table B-8 of the source). The initial estimate for the end of 1889 is based on the average value of owner-occupied nonfarm mortgaged homes reported in the 1890 Census Report, *Real Estate Mortgages* (see pp. 364–365 of the source). The value of structures in current dollars was obtained by adjusting the value in constant dollars by use of the construction cost index given in series N 121 and N 139.

N 199, land. Estimates are based on ratios of land value to total property value, i.e., land and structures, which are estimated to have declined from 40 percent in 1890 to 16.9 percent in 1953, with the move to the suburbs accounting for most of this trend. According to the source (appendix D, p. 364), the ratios are "based on Federal Housing Administration appraisal data and tax assessment data from a number of cities which permit the separation of residential from other real estate. These data do not extend back of the thirties but, together with the bench-mark estimate for the twenties and one for 1907, are sufficient to approximate both the level of the ratio and the direction of the trend." The estimates are fully explained in Louis Winnick, *Wealth Estimates for Residential Real Estate, 1890–1950,* unpublished doctoral dissertation, Columbia University, 1953.

N 200–215. Value of gross and net stocks of residential structures in current and constant (1958) dollars, 1925–1970.

Source: U.S. Bureau of Economic Analysis, *Survey of Current Business,* November 1971, pp. 24–25.

Constant-cost (or "real" or "physical-volume") capital stock measures are derived by valuing all assets at the prices of a specific period (1958 prices in these series) regardless of their actual prices in the years of original purchase. To calculate constant-cost stocks, the gross investment flows must be expressed in constant prices. This is done by applying appropriate price indexes to the current-dollar investment flows. The constant-cost stock measures the physical volume of residential capital.

Beginning with 1963, the current-dollar residential investment series which are components of the gross national product (GNP) are deflated by the Census Bureau's price index for new 1-family houses. Data for years prior to 1963 are deflated by a privately compiled residential construction cost index.

Estimates of gross stocks were derived by using the perpetual inventory method. This method cumulates past flows of residential investment and deducts the investment discarded from the stock. To illustrate, assume a constant rate of investment of $10 million per year in a new type of residential structure with a life of 40 years. Abstracting from price changes, the gross stock of this type of structure, calculated as the difference between cumulated past investment and cumulated discards, would equal $10 million at the end of year 1, $20 million at the end of year 2, and so on, reaching $400 million at the end of year 40. In succeeding years, the stock would stay at $400 million as annual investment was offset by annual discards. Under this "gross" concept, an asset enters the stock with a specific value and carries that value as long as it is in the stock. In other words, assets in the gross stock are not adjusted for any physical wear and tear or obsolescence which may occur during their lives.

Net stock measures, on the other hand, represent the depreciated value of the capital stock. There is no general agreement as to the correct method of computing economic depreciation, the value of productive services of an asset used up each year. One widely accepted accounting method uses the "straight line" pattern, which assumes equal dollar depreciation each year over the life of the asset. Another important method uses the "declining balance" pattern, which assumes equal percentage depreciation each year over the life of the asset. The annual declining balance depreciation charge for an asset will equal a certain fixed percentage of the net (depreciated) value of the asset at the beginning of the year.

The depreciation method used here to compute the net stock estimates was of the declining balance type. A rate of 2 percent per year was applied to the net value of 1–4 unit structures and 2.4 percent per year to the net value of housekeeping structures with 5 or more units. These rates are consistent with the evidence provided in several studies conducted in the 1930's which shows that depreciation of residential housekeeping structures tended to follow a declining balance formula with the annual rate of depreciation in the neighborhood of 2 percent of the net value.

The depreciation rates used for nonhousekeeping residential structures and mobile homes are higher, because of the shorter service lives involved. For all types of residential capital, the declining balance depreciation rates used in this study are equivalent to roughly 1½ times the first year percentage depreciation under straight line method.

The current-dollar value of the total stock of residential structures increased from $80 billion in 1925 to $800 billion in 1970. About five-sixths of this increase was due to price increases, while about one-sixth represented growth of the real net stock.

Several fairly distinct periods of price change can be identified. In the late 1920's, prices changed little and the increase in the current-dollar net stock was due almost entirely to an increase in the real stock. On the other hand, virtually all of the 25 percent drop in the current-dollar stock from 1929 to 1934 was due to a decrease in the price level, and price increases accounted for virtually all of the doubling in value of the stock between 1934 and 1945.

About three-fourths of the increase in the current-dollar net stock since 1945 has been due to inflation. Price increases were particularly significant in the growth of the stock in the immediate postwar period and in the 1960's, but during the 1950's the growth of the real net

stock accounted for 60 percent of the increase in the current-dollar stock.

The Nation's stock of housing has been and continues to be composed predominantly of 1–4 unit structures, most of which are single-family houses. At the end of 1970, private nonfarm 1–4 unit structures accounted for 81 percent of the value of the constant-dollar gross stock of residential structures. Privately owned apartment buildings (structures with 5 or more units) formed the next largest component, accounting for 9 percent of the stock. Farm housing accounted for 4 percent of the stock, while public housing, mobile homes, and private nonhousekeeping residential structures each accounted for about 2 percent.

The annual investment flows used in implementing the perpetual inventory method were those which enter the estimates of the GNP beginning 1929 and are taken from the following sources: *The National Income and Product Accounts of the United States, 1929–65, Statistical Tables*, and July issues of the *Survey of Current Business*.

N 216–231. Mean age of stocks of residential structures, 1925–1970.

Source: See source for series N 200–215.

Information on the age structure of capital stocks is useful in analyzing the condition of the housing stock. Three measures of age structure are presented in the source: The ratio of net to gross stocks, the age distribution of the gross stock, and the average age of gross and net stocks, which is presented here. The net/gross ratios show the extent to which the services available in new residential capital remain intact, while the average age provides information on the absolute ages of gross and net stocks. These two measures can be used interchangeably for many purposes, but each of them also provides specific information. The age distribution of the gross stock shows the proportion of the stock that is of a given age.

The data on the age structure of the gross stock show the effect of the curtailment of residential investment in the depression and World War II years and of the boom in the postwar years. The average age of the gross stock of residential structures increased from 27 years in 1925 to 34 years in 1945. The average age has since declined until in recent years it has approached the level of the late 1920's. The average age of the gross stock of private apartment structures (5 or more units) increased from 15 years in the late 1920's to 26 years by the end of World War II. This trend continued until 1958, when the average age was almost 30 years. As a result of the boom in apartment construction in the 1960's, the average age had declined to 20 years by 1970. In 1970, over half of the gross stock of private apartments had been built in the past ten years. Farm housing, the oldest component of the stock, has steadily increased in age. More than half of the gross stock in 1970 was over 50 years of age.

N 232–237. Comparison of residential wealth estimates, 1890–1950.

Source: See Grebler-Blank-Winnick source for series N 192–195, table D-3.

There are basically two procedures for estimating residential wealth (as well as other wealth components). One procedure uses a benchmark estimate of wealth in an initial year and adds to it the yearly net capital increments. This procedure yields cumulated wealth estimates, series N 232–234. The other procedure is based on census or similar estimates of wealth at different dates, benchmark wealth estimates, series N 235–237. For a description of the conceptual and estimating problems involved in these two procedures and for the sources of the estimates, see appendix D of the source.

The juxtaposition of wealth estimates derived by various methods indicates clearly the fairly large variations that may result from the employment of these methods, and should caution the user against placing excessive confidence in any particular wealth figures.

N 238–245. Occupied housing units and tenure of homes, 1890–1970.

Source: U.S. Bureau of the Census, 1890–1950, except 1910 and 1945, *U.S. Census of Housing: 1950*, vol. I, part 1, tables J and L; 1945, *Special Census Reports on Housing*, "Characteristics of Occupied Dwelling Units for the United States: November 1945," series H 46, No. 1; 1956, *National Housing Inventory, Components of Change: 1950–1956;* 1960 and 1970, *U.S. Census of Housing: 1960*, vol. I, part 1 and *1970*, vol. I, part 1. The 1910 figure for farm population, series N 239, is an estimate which appears in Leon E. Truesdell, *Farm Population of the United States, 1920*, Census Monographs VI, Washington, D.C., 1926, p. 45. The 1910 figure for nonfarm population was derived by subtracting the estimated farm population from the total population.

The first nationwide census of housing was taken in 1940. In 1940, 1950, 1956, 1960, and 1970, a housing (dwelling) unit was defined in general as the living quarters occupied or intended for occupancy by one household. Figures for 1890 to 1930 rest on the fairly close correspondence between the concept of occupied housing unit used in the housing censuses since 1940 and concepts used in previous censuses of population. Perfect comparability of all the figures in the series is not possible because of various relatively minor changes in definition. The figures for 1890, 1910, and 1920 include the small number of institutions, hotels, military installations, dormitories, etc., which were not included in the counts for any of the other years. For 1940, 1960, and 1970, the count of occupied housing units includes living quarters with five lodgers or more whereas for 1950 and 1956 such living quarters were not included.

For all years, the figures for population per occupied housing unit were obtained by dividing the total population by the number of occupied housing units. The figures for 1950–1970 shown here are not identical with the population per occupied housing unit as shown in the census volumes because the latter figures were derived by dividing the total population living in occupied housing units by the number of occupied units.

The number of occupied housing units is closely comparable to the number of households as shown in series A 288. Since 1950, the number of occupied housing units has been identical by definition to the number of households. The small difference between the number of households and the number of occupied housing units is due to occasional errors in the separate tabulation processes of the census of population and the census of housing. In 1940, small differences existed by definition between the number of occupied housing units and the number of households. The usual occupants of a housing unit who were temporarily away and were enumerated elsewhere were included in the count of households but their housing unit was not considered to be occupied. In addition, a small number of lodginghouses in 1940 (those with 11 or more lodgers) were counted as occupied units, but the heads of these units were not counted as household heads. The figures shown for occupied dwelling units for 1890–1930 are identical to those shown for heads of households in series A 288.

With reference to the farm-nonfarm classification, enumeration of the 1960 and 1970 censuses was conducted primarily through self-enumeration; however, enumerators in the National Housing Inventory of 1956 and the 1950 census were specifically instructed to base the classification of a dwelling unit on the respondent's answer to the question, "Is this house on a farm?" Farm residence was, therefore, determined without regard to the occupation of the members of the household. Housing units located on farmland for which cash rent was paid for the house and yard only, and housing units on institutional grounds and in summer camps and tourist courts, were classed as nonfarm, regardless of the answer to the foregoing question.

For 1960 and 1970, occupied housing units were classified as farm units if they were located on places of 10 or more acres from which sales of farm products amounted to $50 or more in 1959 and 1969, respectively; or on places of less than 10 acres from which sales of farm products amounted to $250 or more in 1959 and 1969, respectively.

For 1930–1950, "farm" consists of rural-farm units only. The classification "rural farm" used in 1950 differs slightly from that used in 1940. As a result, there was, in 1950, an expansion in the urban fringe of cities, tending to reduce the number of farms. On the other hand, in 1940 some areas were classified as urban which were not so classified in 1950. Thus, the differences partly offset each other. In addition, the number of farms was reduced in 1950 by the exclusion of renter-occupied units on farms paying rent for the use of house and yard only.

A housing unit is classified as owner occupied if it is owned wholly or in part by the head of the household or by some related member of his family living in the housing unit. A cooperative or condominium unit is owner occupied only if the owner or co-owner lives in it. All other occupied units are renter occupied whether or not cash rent is actually paid.

N 246–258. Housing units vacancy rates, by region, 1940–1970.

Source: U.S. Bureau of the Census, 1940, *U.S. Census of Housing*, vol. II, part 1, table 28; 1950, *U.S. Census of Housing*, vol. I, part 1, table 17; 1956–1970, Current Housing Reports, *Housing Vacancies*, series H 111, No. 43, tables F and 1 and series H 111-73-5, tables 1 and 4.

A housing unit is vacant if no one is living in it at the time of enumeration, unless its occupants are only temporarily absent. In addition, a vacant unit may be one which is entirely occupied by persons who have a usual residence elsewhere. New units not yet occupied are classified as vacant housing units if construction has reached a point where all exterior windows and doors are installed and final usable floors are in place. Vacant units are excluded if unfit for human habitation, that is, roof, walls, windows or doors no longer protect the interior from the elements, or if there is positive evidence (such as a sign on the house or in the block) that the unit is to be demolished or is condemned. Also excluded are quarters being used entirely for nonresidential purposes, such as a store or an office, or quarters used for storage of business supplies or inventory, machinery, or agricultural products. Vacant sleeping rooms in lodging houses, transient accommodations, barracks, and other quarters not defined as housing units are not included in these series.

Homeowner vacancy rate. The percentage relationship between the vacant units for sale and the total homeowner inventory is termed the homeowner vacancy rate. It is computed by dividing the number of vacant units for sale by the total homeowner units. The total homeowner units comprise owner-occupied units, vacant units sold and awaiting occupancy, and the vacant units for sale. Vacant units that are seasonal or held off the market are excluded. Vacant units for sale that were rated as dilapidated are also excluded.

Rental vacancy rate. The percentage relationship of the vacant units for rent to the total rental inventory is termed the rental vacancy rate. It is computed by dividing the number of vacant units for rent by the total rental units. Total rental units comprise renter-occupied units, vacant units rented but not yet occupied at the time of enumeration, and the vacant units for rent. Excluded are seasonal vacant units, units held off the market, and vacant units rated as dilapidated.

Year-round vacant units are those intended for occupancy at any time of the year, even though they may not be in use the year round. In resort areas, a housing unit which is usually occupied on a year-round basis was considered a year-round unit. On the other hand, a housing unit located in the closely built-up area of a nonresort city was considered a "year-round" unit even though it may be occupied only part of the year.

Seasonal housing units are those intended for occupancy during only a season of the year and are found primarily in resort areas. In farm areas, housing units used for only a portion of the year to house migratory workers employed during the crop season are classified as seasonal.

The enumeration of vacant units in the 1950 Census of Housing was not entirely comparable with the procedures used in 1940 nor with those used in the Current Population Survey to obtain the data for 1956–1970. In 1950, all vacant units, whether or not dilapidated, were included if they were intended for occupancy as living quarters. Where there was little or no demand for housing, many houses were not enumerated because they were used for storage or were abandoned and no longer intended for occupancy as living quarters.

N 259–261. General note.

The development of price indexes for any kind of urban real estate is unusually difficult because of the great heterogeneity of the product and the local nature of real estate markets. The problem of heterogeneity is somewhat less serious in the case of 1-family houses. For a discussion of the conceptual difficulties of using construction cost indexes for measuring price changes for homes and of distinguishing between prices for new and old homes, see Grebler-Blank-Winnick (cited as source for series N 192–195), appendix C. Only a few attempts have been made to measure price changes of urban real estate. For additional data of this type, see Herman Wyngarden, "An Index of Local Real Estate Prices," *Michigan Business Studies*, vol. 1, No. 2, University of Michigan, Bureau of Business Research, 1927; William M. Hoad, *Real Estate Prices, a Study of Residential Real Estate Transfers in Lucas County, Ohio*, unpublished doctoral dissertation, University of Michigan, 1942; and data for Cleveland and Seattle given in Grebler-Blank-Winnick, table C-2. See also Ernest M. Fisher, *Urban Real Estate Markets: Characteristics and Financing*, National Bureau of Economic Research, 1951, pp. 51–56.

Beginning 1963, the Bureau of the Census has developed a price index for new 1-family houses sold, including value of lot on a 1967 = 100 base. See U.S. Bureau of Domestic Commerce, *Construction Review*, May 1974, p. 58.

N 259–260. Price indexes for 1-family owner-occupied houses, 1890–1934.

Source: See Grebler-Blank-Winnick source for series N 192–195, tables C-1 and C-3.

Unadjusted figures were derived from detailed information for a sample of residential properties in 22 cities in Department of Commerce, *Financial Survey of Urban Housing, 1937*. This survey, among other things, ascertained the value of the property in 1934, the year of acquisition by the then-present owner, and original cost to the owner at time of acquisition, regardless of whether the house was new or old at that time. From these data, a relative for each year was calculated for each city, based on the ratio of the total acquisition cost of the single-family owner-occupied houses acquired in each given year in a given city to their value in 1934. The unadjusted figures are median relatives derived from the data for all of the 22 cities and are subject to a downward bias due to the changing age structure of properties included in each year's sample, and to an upward bias due to value increments in the form of structural additions and alterations. The adjusted figures are corrected for the resulting net downward bias, by allowing 1¾ percent compound annual depreciation. See the source, appendix C, for details of correction.

N 261. Median asking price for existing 1-family houses, Washington, D.C., 1918–1947.

Source: Ernest M. Fisher, *Urban Real Estate Markets: Characteristics and Financing*, National Bureau of Economic Research, New York, 1951, table 6 (copyright).

This series represents the results of an experimental study by the National Housing Agency (a predecessor of the U.S. Department of Housing and Urban Development) of a sample of newspaper advertisements. Similar experimental indexes, but for shorter periods, were developed for 100 metropolitan areas. The principal limitations of the study, fully recognized by the originating source, are as follows:

(1) Because of the changing composition of the sample, the type of houses included may vary from period to period. Consequently, fluctuations in median prices may be due either to change in asking prices or to change in the type of houses advertised; (2) because of the omission of houses advertised without listing price and of houses sold without newspaper advertisement, a sizable segment of total sales is not considered in the series; and (3) there may be cyclical differences in the spread between asking prices and selling prices.

N 262–272. Residential nonfarm mortgage debt outstanding, by type of holder, 1890–1970.

Source: 1890–1952, see Grebler-Blank-Winnick source for series N 192–195, tables N-1 and N-2; 1952–1956, Saul B. Klaman, *The Volume of Mortgage Debt in the Postwar Decade: Appraisal and Development of Statistics*, Technical Paper 13, National Bureau of Economic Research, New York, 1958 (copyright); 1956–1970, Board of Governors of the Federal Reserve System, *Federal Reserve Bulletin*, various monthly issues.

The Grebler-Blank-Winnick estimates are based largely on Raymond W. Goldsmith, *A Study of Saving in the United States*, vol. I, Princeton University Press, 1955. Because of the paucity of reliable data, particularly for earlier years, and the consequent employment of ratios found for benchmark years and interpolations or extrapolations, the estimates must be used with caution. The Grebler-Blank-Winnick figures were slightly modified to take account of later revisions by the Federal Home Loan Bank Board (FHLBB) of its estimates of debt on 1- to 4-family houses for 1938–1952; see Federal Home Loan Bank Board, *Estimated Home Mortgage Debt and Financing Activity, 1955* (release, March 1956).

The study by Klaman contains alternative estimates for 1945–1952 which are not entirely comparable with the figures shown here. Because of new information and improved estimating techniques, these data are superior to those in Grebler-Blank-Winnick for overlapping years. The differences reflect mainly lower estimates by Klaman for the mortgage debt on multifamily residences and are fully explained in Klaman's paper. The Klaman paper presents also a comprehensive methodology and a more detailed classification of mortgage debt estimates. See also J. E. Morton, *Urban Mortgage Lending: Comparative Markets and Experience*, Princeton University Press, 1956.

Federal Reserve Board figures are based on data from the Federal Deposit Insurance Corporation, Departments of Agriculture and Commerce, Federal National Mortgage Association, Government National Mortgage Association, Federal Housing Administration, Public Housing Administration, Veterans Administration, Federal Home Loan Mortgage Corporation, Comptroller of the Currency, Federal Home Loan Bank Board, and the Institute of Life Insurance.

N 262, total debt, including real estate bonds. For 1910–1949, the underlying estimates for real estate bonds outstanding on residential property are those of Goldsmith, table R-43. For 1950–1952, figures are estimates based on extrapolation of Goldsmith's data for 1946–1949 for total bonds and assume that 40 percent of these were secured by residential property. This is the ratio applied by Goldsmith for 1910–1949. For the 1890–1909 figures, it was assumed that there were no residential real estate bonds outstanding.

N 263, total debt, excluding real estate bonds. For 1890–1920, figures are based on Goldsmith's estimates of the residential mortgage debt (table R-40) for 1890 and 1920 modified as explained in appendix L of Grebler-Blank-Winnick. The annual estimates between 1890 and 1920 are derived, following Goldsmith's procedures, by interpolating the ratios of nonfarm residential to total nonfarm mortgage debt between the ratios for the two benchmark years. For 1921–1924, figures are those of Goldsmith, derived by interpolation between the 1920 estimate and the 1925 estimate, except that revised FHLBB data for the 1925 debt on 1- to 4-family houses were used. For basis of 1925–1952 figures, see text for series N 273–275 and N 276–277.

N 264–265, noninstitutional and institutional debt. Noninstitutional figures represent the difference between series N 263 and N 265. Institutional figures are the sum of series N 266–272. The estimates for noninstitutional debt are probably the weakest component from the viewpoint of reliability. They represent largely a residual derived from the independent estimates of total debt and those of institutional holdings. Data for 1956–1970 include estimates for insurance companies other than life, mortgage companies, pension funds, credit unions, and installment investment companies.

N 266, debt held by commercial banks. For 1896–1924, figures are based on estimates of total nonfarm mortgages of operating and closed commercial banks shown in Grebler-Blank-Winnick, tables N-10 and N-12, with the 1925 ratio of residential to total nonfarm mortgages for operating banks applied to the entire period. For 1925–1952, figures represent the sum of (1) FHLBB estimates of the holdings of mortgages on 1- to 4-family housing by operating commercial banks, plus those of closed banks (given in Grebler-Blank-Winnick, table N-12), and (2) FHLBB estimates for 1925–1934 and of the Federal Reserve Board for 1935–1952. For 1953–1956, figures are from Klaman, table 4.

N 267, debt held by mutual savings banks. For 1896–1924, figures are based on estimates of total nonfarm mortgages held by mutual savings banks shown in Grebler-Blank-Winnick, table N-8, and on the application of the 1925 ratio of residential to total nonfarm mortgages. For 1925–1938, figures are the sum of (1) FHLBB estimates for mortgages on 1- to 4-family housing and (2) estimates of multifamily residential mortgages based on recent ratios of such mortgages to total nonfarm mortgages other than those on 1- to 4-family housing. For 1939–1952, figures are from *Federal Reserve Bulletin*, March 1954, p. 289 and for 1953–1956, are from Klaman, table 4.

N 268, debt held by savings and loan associations. For 1896–1924, figures are from Goldsmith, table M-4. For most of the period, these estimates are derived by applying to aggregate assets of savings and loan associations the ratio of mortgage loans obtained from a sample of States accounting for nearly two-thirds of aggregate savings and loan assets. For 1925–1950, figures are FHLBB estimates plus the holdings of closed savings and loan associations as given in Grebler-Blank-Winnick, table N-12. For 1951 and 1952, figures are FHLBB estimates.

N 269, debt held by life insurance companies. For 1896–1924, figures are based on estimates of total nonfarm mortgages held by life insurance companies, given in Grebler-Blank-Winnick, table N-9, and application of the 1925 ratio of residential to total holdings. For 1925–1952, figures are the sum of (1) FHLBB estimates of holdings of mortgages on 1- to 4-family houses and (2) estimates of mortgages on multifamily residential property. The latter are from Goldsmith, table M-10, for 1925–1937; from a FHLBB release, *Mortgage Investments of Life Insurance Companies*, 1951, for 1938–1951; and from the Institute of Life Insurance for 1952. For 1953–1956, figures are from Klaman, table 4.

N 270, debt held by the Home Owners' Loan Corporation (HOLC). Figures are from reports of HOLC and include outstandings on both original HOLC loans and on loans originating from the sale of property acquired by HOLC through foreclosure or similar proceedings.

N 271, debt held by the Federal National Mortgage Association (FNMA). Figures are from reports of FNMA and cover all programs of that agency. Under law, only mortgage loans insured by the Federal Housing Administration or guaranteed by the Veterans Administration are eligible for purchase by FNMA. Beginning 1968, "old" FNMA was split between FNMA and the Government National Mortgage Association.

N 272, debt held by other institutions. Figures for 1896–1952 combine data given separately in the source for insurance companies other than life, mortgage companies, and installment investment companies. Figures for 1956–1970, provided by the Federal Reserve Board, include only data for other Federal agencies (Veterans Administration, Federal Housing Administration, Federal National

Mortgage Association, Federal Home Loan Mortgage Corporation, and Government National Mortgage Association (guaranteed pools)).

N 273–275. Residential nonfarm mortgage debt outstanding on 1- to 4-family homes, 1925–1970.

Source: 1925–1955, U.S. Housing and Home Finance Agency, *Annual Report, 1956*, table A-24; 1956–1970, Board of Governors of the Federal Reserve System, *Federal Reserve Bulletin*, various monthly issues.

The total debt on 1- to 4-family structures is estimated by the Federal Home Loan Bank Board (FHLBB) in its annual releases, "Estimated Home Mortgage Debt and Financing Activity." Mainly because such property may be owner occupied, tenant occupied, or vacant, the data are not comparable to census figures on mortgage debt of owner-occupied housing. The estimates are based on reports to FHLBB of savings and loan associations, mortgage investment data reported by life insurance companies, information on mutual savings banks' holdings from call reports and other data collated by FHLBB, similar information collated by the Board of Governors of the Federal Reserve System for commercial banks, financial statements of the Home Owners' Loan Corporation, the Federal National Mortgage Association, and the Government National Mortgage Association, and less reliable information for holdings of individuals and others. The latter group includes mortgages held by trusts and trust departments of commercial banks, pension funds, philanthropic and educational institutions, casualty and fire insurance companies, real estate and mortgage companies, RFC Mortgage Company, Federal Housing Administration (FHA) and Veterans Administration (VA), and individuals. The estimates for holdings of individuals and others are based on residential finance surveys of the Bureau of the Census, trends in nonfarm mortgage recordings, FHA and VA records, and other information. See source for data by type of mortgagee.

The data for government-underwritten mortgages are the outstanding balances of loans insured by FHA and guaranteed by the VA, as estimated by these agencies from their records.

For rough estimates of mortgage debt on 1- to 4-family structures for 1890–1924, see Goldsmith's *A Study of Saving . . .* (cited in text for series N 262–272), vol. I, table R-34.

N 276–277. Residential nonfarm mortgage debt outstanding on 5-or-more unit structures, 1925–1970.

Source: See sources for series N 273–275.

The estimates for total of 5 or more units represent revisions of those in Grebler-Blank-Winnick (see source for series N 192–195), table L-4, which were undertaken by the Board of Governors, Federal Reserve System. Because of these revisions, the sum of series N 273 and N 276 does not equal the totals shown in series N 263.

The data for FHA-insured mortgages are estimates of the Federal Housing Administration based on unpublished data.

N 278–290. General note.

While the annual changes in the amount of residential mortgage debt outstanding, series N 262–277, indicate the net flow of funds, measures of the gross flow of funds are useful for many purposes. However, these measures are far from adequate. For estimates of the gross flow of funds into *new* residential construction for 1911–1955, see Grebler-Blank-Winnick series N 192–195, appendix M and table 80.

N 278–284. Mortgage loans on 1- to 4-family houses, by type of lender, 1925–1950.

Source: See Grebler-Blank-Winnick source for series N 192–195, table N-13. (Figures are from Federal Home Loan Bank Board, *Estimated Home Mortgage Debt and Lending Activity, 1950.*)

These series represent only rough approximations except for the Home Owners' Loan Corporation and for savings and loan associations since the late thirties. The estimates were based on scattered reports of national and State supervisory authorities, special reports to the Home Loan Bank Board by life insurance companies, and, for 1939–1950, on mortgage recordings figures, series N 285–290. Estimates for the earlier years, and for "individuals and others" throughout, are highly tentative.

N 285–290. Mortgage recordings of $20,000 or less, by type of lender, 1939–1964.

Source: Federal Home Loan Bank Board, *Savings and Home Financing Source Book*, annual issues.

Estimates are computed on the basis of monthly reports of cooperating institutions. These reports cover approximately 500 areas containing about 54 percent of the total nonfarm 1-family housing units. Activity in the remaining areas is estimated usually by reference to the closest reporting area. To relate the series as closely as possible to home-financing operations, it is limited to mortgages of $20,000 or less, but it includes small mortgages secured by nonresidential real estate and omits large mortgages secured by residences.

The *Savings and Home Financing Source Book, 1966*, contains the following: "Since almost every mortgage is recorded, the series provides an adequate means of determining trends in real estate financing activity, as well as the role being played by various types of lenders. Summaries are made on the basis of the originating mortgagees, and, for this reason, assignments of mortgages are not reflected in the series. To the extent that certain lenders (e.g., insurance companies) purchase mortgages originated and recorded by other lenders (e.g., mortgage companies), the recording statistics may overstate or understate the importance of a particular type of lender as the ultimate source of mortgage credit. It should also be pointed out that mortgage recording data are not directly comparable with estimates on home mortgage lending; the periods covered are not necessarily the same, because lending statistics are reported as of the date of loan commitment, while recording figures reflect the actual date of mortgage registration. Furthermore, alterations in the terms of an existing contract may necessitate a new registration. In the case of refinancing an institution's own mortgage, for example, the face amount of the instrument would appear in the recording totals, whereas only that portion which represented an increase of funds loaned would be included in the lending figures."

N 291–300. Major Federal housing finance programs, 1934–1970.

Source: **Series N 291–297** and **N 300**, 1934–1970 (except N 297, 1950–1970), see source for series N 273–275, Real Estate Credit section. **Series N 297**, 1950–1964, Housing and Home Finance Agency, *Annual Report, 1964*, table B-72; 1965–1970, U.S. Veterans Administration, unpublished data. **Series N 298–299**, Federal National Mortgage Association, unpublished data.

The figures are based on records of the Federal Housing Administration (FHA), Veterans Administration (VA), Federal National Mortgage Association (FNMA), Federal Home Loan Bank Board (FHLBB), and Government National Mortgage Association (GNMA).

N 291–296, loans made with FHA insurance. Figures are from FHA. Homes include 1- to 4-family houses. Projects include multifamily housing. Under law, only new multifamily projects are eligible for FHA-insured mortgage loans, although such projects are later eligible for refinancing loans. For the FHA classification of new and existing houses, see text for series N 180–181.

N 297, loans made with VA guaranty. Figures are from VA and show the total principal amount of loans, not the guaranteed portion which is smaller. In addition to the loans made by private lenders under its guaranty program, the VA has made direct loans for home purchase to veterans in certain areas since fiscal year 1951. The cumulative amount of direct loans disbursed through December 31, 1970, was $3 billion.

N 298–299, FNMA purchases and sales. Figures are from FNMA and include all its programs. Beginning 1954, FNMA established three independent portfolios of FNMA-owned mortgages with separate accountability. The three portfolios resulted from separate operations predicated on different purposes and objectives: (1) Secondary market operations, basically a privately financed activity; (2) special assistance functions, operated for the account of the government; and (3) management and liquidating functions, under which the FNMA managed and operated for the government the portfolio of mortgages acquired since 1938 under the FHA. Beginning 1968, FNMA separated into two organizations, the Government National Mortgage Association, which maintains the special assistance functions and the management and liquidating functions portfolios; and the "new" FNMA which maintains the secondary market operation portfolio.

N 300, advances outstanding of the Federal Home Loan Banks. Figures are from FHLBB and represent advances to member institutions of the Federal Home Loan Bank System, mainly savings and loan associations.

N 301. Real estate foreclosures of nonfarm properties, 1926–1970.

Source: Federal Home Loan Bank Board, *Savings and Home Financing Source Book*, annual issues.

Estimates for the old series are based on reports for approximately 1,700 counties, cities, townships, or other governmental divisions in 1968. The reporting areas include approximately three-fifths of all nonfarm single-family housing units. Foreclosures in the remaining areas are estimated usually by reference to the closest reporting area. Figures represent the number of nonfarm properties, residential and nonresidential, acquired by mortgage lenders through foreclosure proceedings; they do not include voluntary transfers to such lenders in lieu of foreclosure, or defaults on real estate contracts.

Foreclosure estimates consist of completed foreclosures—those that result in a sale or final action.

N 302–307. Mortgage status of nonfarm owner-occupied housing units, 1890–1970.

Source: **Series N 302–306,** U.S. Bureau of the Census, 1890–1950, *U.S. Census of Housing: 1950*, vol. I, part 1; 1956, *National Housing Inventory, 1956*, vol. II; and 1960 and 1970, *U.S. Census of Housing: 1960*, vol. V, and *1970*, vol. V, respectively. **Series N 307,** 1890–1950, see Grebler-Blank-Winnick source for series N 192–195, table 59 (based on census data for value and debt); 1956, 1960, and 1970, same as for series N 302–306.

For 1940, 1950, 1956, 1960, and 1970, the mortgage statistics are for owner-occupied housing units in 1- to 4-family housing unit structures without business. For 1890–1920, they are for owner-occupied units in all types of structures. These differences are not large enough to invalidate comparisons.

★★★★★★★★★ **More Recent Data for *Historical Statistics* Series** ★★★★★★★★★

Statistics for more recent years in continuation of many of the still-active series shown here appear in annual issues of the ***Statistical Abstract of the United States,*** beginning with the 1975 edition. For direct linkage of the historical series to the tables in the ***Abstract,*** see Appendix I in the ***Abstract.***

[1] As of December 31.
[2] Occupied or available for occupancy.
[3] Comprises units to be constructed and units that will go directly into "under management" category because they need no rehabilitation.
[4] Refers to period between completion of construction and actual occupancy.
[5] Excludes units which have been sold to mutual housing associations, limited dividend corporations (PWA), and homestead associations on which HUD has mortgages for collection.

* Denotes first year for which figures include Alaska and Hawaii.
NA Not available.
[1] Figures for 1956 are for December 31; figures for 1945 are for November 1; figures for decennial years, 1890 to 1970, are for census dates.
[2] Farm-nonfarm breakdown will not add to total; "Total" figures were revised as a result of errors found after the tabulations were completed.
[3] These figures are not comparable with other years; based on sample surveys.
[4] Estimated; see text.

Series N 246–258. Housing Units Vacancy Rates, by Region: 1940 to 1970

[**In percent.** Annual averages, except as noted. For composition of regions, see text for series A 172–194]

Chapter P

Manufactures

P 1–374. General note.

Manufacturing is the mechanical or chemical transformation of inorganic or organic substances into new products. The assembly of component parts of products is also considered to be manufacturing if the resulting product is neither a structure nor other fixed improvement. These activities are usually carried on in plants, factories, or mills, which characteristically use power-driven machines and materials-handling equipment.

Manufacturing production is usually carried on for the wholesale market, for transfer to other plants of the same company, or to the order of industrial users rather than for direct sale to the household consumer. However, some manufacturers (e.g., baking, milk bottling, etc.) sell chiefly at retail to household consumers through the mail, house-to-house routes, or salesmen. Some activities of a service nature (enameling, binding, platemaking, etc.) are included in manufacturing when they are performed primarily for the trade; but they are considered nonmanufacturing when they are performed primarily to the order of the household consumer. On the other hand, some manufacturing industries include business firms which do not undertake physical production but perform only the entrepreneurial functions of buying the materials, designing, and marketing the product, and have the actual production done on contract (e.g., apparel jobbers).

In addition to the production of goods and manufacturing services, manufacturing plants engage in related and diverse supporting activities. These activities encompass the acquisition of materials to be processed, their movement into the manufacturing facility, their storage at the manufacturing site, the operation and maintenance of plant and equipment, the design of flow of work through the production process, and necessary arrangements for shipment of output to customers. Also included are a host of subsidiary activities associated with the conduct of the establishment as a manufacturing entity; e.g., management and policy formation, product and market orientation, engineering and quality control, record keeping and accounting, physical security of plant and equipment, and the like. Such subsidiary activities may be performed by personnel located at the manufacturing facility or at an auxiliary unit serving one or more manufacturing locations of the same company. Where these activities are carried on at a different physical location or are performed for more than one plant, they are excluded from the figures for operating manufacturing establishments and are included in the data shown for central administrative offices and auxiliaries in the source reports.

The *Standard Industrial Classification* (SIC) *Manual*, published by the Office of Management and Budget, is a classification structure for the entire national economy. It was first issued in 1939. For the manufacturing industries, a revised manual was issued in 1945 which, with minor modifications, was used in the 1947 Census of Manufactures. For the 1954 census, the classification structure used in 1947 was again employed, again with minor modifications. In 1957, the SIC system was extensively revised for manufacturing industries and historical comparability of some data was seriously affected. This revision and its effects on census series are described in the introduction and appendixes to the 1958 Census of Manufactures volumes. A minor revision of the SIC occurred between 1958 and 1963. Another extensive revision of the SIC was issued in 1972.

In the manufacturing sector, the SIC *Manual* built upon the Bureau of the Census manufacturing industry classifications developed over the years. The SIC system was developed for use in classifying establishments by type of activity in which they are engaged in order to facilitate the collection, tabulation, and publication of data relating to establishments and to promote uniformity and comparability in the presentation of statistical data by government agencies, trade associations, research organizations, and others. The SIC system divides all activities into broad industrial divisions (manufacturing, mining, retail trade, agriculture, etc.). It further subdivides each division into major industry groups, then into industry groups, and finally into detailed industries.

Except as noted, Alaska and Hawaii are included in census of manufactures data and in annual survey of manufactures data beginning 1958.

P 1–12. Manufactures summary, 1849–1970.

Source: U.S. Bureau of the Census, *Annual Survey of Manufactures, 1970–1971*, p. 10.

The basic source of comprehensive data on manufactures has been the census of manufactures conducted by the Bureau of the Census. The first census of manufactures covered 1809. A census was taken at 10-year intervals thereafter to 1899 (with the exception of 1829), at 5-year intervals for 1904–1919, and biennially for 1921–1939. The census was suspended during World War II, but was resumed for 1947. Legislation enacted in 1948 provided for a census of manufactures every 5 years, with annual sample surveys authorized for interim years. The 1954 census was the first to be taken as a result of this legislation. Subsequently, the census intervals were revised and censuses were taken in 1958, 1963, and 1967. Annual surveys of manufactures were conducted every year beginning 1949, except during census years. The data from the annual surveys represent estimates derived from a sample of manufacturing establishments canvassed. These estimates may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The relative standard errors (measures of the potential differences) associated with these estimates are published in the annual survey volumes.

There have been changes in scope from one census of manufactures to another. For "factories and hand and neighborhood industries," data for 1849–1899 are for all establishments with products valued at $500 or more. For "factories, excluding hand and neighborhood industries," data for 1899–1919 are for establishments reporting value of shipments of $500 or more; for 1921–1939, for establishments reporting value of shipments of $5,000 or more, while data beginning 1947 are for establishments employing one or more persons at any time during the census year. These changes in the minimum size limit have not appreciably affected the historical comparability of the census figures except for data on number of establishments.

There have also been a number of changes in the definition of manufacturing industries. Among the more important were changes in the treatment of "railroad repair shops" and "manufactured gas." These industries are included in the figures for 1899–1933, but excluded for 1935–1970. When the change results in the omission of an entire industry for which separate tabulations are available during each census, the adjustments are usually carried back through the previous censuses. Beginning 1954, the figures cover the logging camps and contractors industry, which was not included within the scope of the 1947 census; and establishments engaged in the processing and distribution of fluid milk, which were not included in the figures for earlier census years. Beginning 1958, the figures cover establishments classified in the ready-mixed concrete industry, and establishments classified in the miscellaneous machinery industry that were engaged exclusively or almost exclusively in machine shop repair work. Data for

such establishments are excluded for 1939 to 1957 but included for 1929 and earlier years.

For a discussion of changes between 1929 and 1958, see U.S. Bureau of the Census, *Census Working Paper*, No. 9, 1959, by Harold T. Goldstein. There have been no major changes since 1958.

P 1–2, number of establishments. The reporting units in each census have been establishments rather than legal entities or companies. Conceptually, an establishment is a geographically isolated manufacturing unit maintaining independent bookkeeping records, regardless of its managerial or financial affiliations. An establishment may be a single plant, a group of closely located plants operated as a unit, or a group of closely located plants operated by a single company without separate records for each. The establishment is also the basic unit of industrial classification, being assigned to an industry on the basis of its reported product of chief total value. Establishments owned and operated by the Federal Government are excluded from census coverage.

P 3–5, persons engaged in manufacturing. The figures for 1939–1970 exclude personnel reported by manufacturing establishments as in distribution and in construction work (the 1939 and subsequent censuses required separate reporting for such employees). Therefore, the employee figures for earlier years probably are not strictly comparable with those for 1939–1970. It is not known how many of the wage earners and the salaried employees reported in previous censuses were engaged in distribution and construction, and how many were engaged in manufacturing. The figures for nonproduction employees are derived by subtracting the figures for production workers from those for all employees shown in the source. For nonproduction employees, series P 4, the figures for 1939 and earlier years refer to one payroll period, usually in October; for 1947, to an average of 12 monthly figures; for 1949 to 1954, to an average for the payroll period ended nearest the 12th of March, May, August, and November; and for 1955 to 1970, to the payroll period ended nearest the 12th of March. For production workers, series P 5, the figures for 1947 and earlier years represent the average of 12 monthly figures; for 1949 to 1970, they are based on employment for the payroll period ended nearest the 12th of March, May, August, and November.

Employees comprise all full-time and part-time employees on the payrolls of operating establishments who worked or received pay for any part of the pay period specified on the report form. Officers of corporations are included as employees; proprietors and partners of unincorporated firms are, however, excluded from the total. In recent censuses, employment at separate administrative offices and auxiliary units is excluded from this category.

There has not been a consistent treatment of employees in central administrative offices. The latter are defined as offices which operate one or more manufacturing plants located in a city or cities other than that in which the administrative office is located. For the censuses of 1909–1923, data on employees in such offices were collected on a separate "administrative schedule" and were tabulated and included with those for salaried employees (and, therefore, with all employees) of the manufacturing plants. Thereafter, these data were collected and tabulated for the censuses of 1925, 1929, and 1937. Beginning 1954, separate data on employment in administrative offices and auxiliary establishments were compiled in census years and are shown in census of manufactures publications. The figures for nonproduction employees for 1925 and 1929 include employees in central administrative offices. To make the 1937 figure for nonproduction employees more comparable to the figures for 1929 and earlier years (except 1927), 130,854 employees in central administrative offices should be added to the 1937 figure (*1937 Census of Manufactures*, p. 1652), and to make the 1954 figure more comparable to the figures for 1929 and earlier years (except 1927), 474,256 employees in administrative and auxiliary units should be added to the 1954 figure (*U.S. Census of Manufactures: 1954*, vol. II, part 1, p. 2).

Collection of data on proprietors and partners was discontinued after the 1963 census.

Production workers are defined as workers (up through the working foreman level) engaged in fabricating, processing, assembling, inspection, receiving, storage, handling, packing, warehousing, shipping (but not delivering), maintenance, repair, janitorial, watchman services, product development, auxiliary production for plants' own use (e.g., power plant), recordkeeping, and other services closely associated with these production operations at the establishment covered by the report. Supervisory employees above the working foreman level are excluded from this category.

Decennial estimates of wage earners (production and related workers) excluding hand and neighborhood industries have been prepared for 1869–1899 by John W. Kendrick and Maude Pech for the National Bureau of Economic Research. The following is the estimated number of wage earners for each of these years: 1869, 1,803,000; 1879, 2,454,000; 1889, 3,562,000; 1899, 4,496,000. This estimate for 1899 differs from the official Census Bureau estimate (series P 5) by only one-tenth of one percent. For details of estimating procedure, see John W. Kendrick, *Productivity Trends in the United States*, National Bureau of Economic Research, New York, 1961, appendix D.

P 6, man-hours, production workers. This series covers all plant man-hours of production and related workers. It represents all man-hours worked or paid for except hours paid for vacations, holidays, or sick leave and includes actual overtime hours. Where employees elected to work during vacation periods, only the actual hours they worked were reported. The man-hour figures issued by the Census Bureau differ from those published by the Bureau of Labor Statistics which cover all hours paid for, whether or not worked.

P 7–9, payroll. These figures include gross earnings paid in the calendar year to all employees on the payroll of operating manufacturing establishments. They include all forms of compensation such as salaries, wages, commissions, dismissal pay, all bonuses, vacation and sick leave pay, and compensation in kind, prior to such deductions as employees' Social Security contributions, withholding taxes, group insurance, union dues, and savings bonds. Salaries of officers of these establishments are included for corporations; payments to proprietors and partners are excluded for unincorporated concerns. Also excluded are payments to members of Armed Forces and pensioners carried on the active payrolls of manufacturing establishments. Employers' Social Security contributions or other nonlabor costs such as pension plans, group insurance, and workmen's compensation are also excluded.

P 10, value added by manufacture. The standard formula for calculating value added by manufacture since 1958 differs from the one used for 1954 and earlier years. Prior to 1958, the value added of an establishment was calculated by subtracting the cost of materials, supplies, containers, fuels, purchased electric energy, and contract work from the value of shipments for products manufactured plus miscellaneous receipts for services rendered. This is known as unadjusted value added. Beginning 1958, the measure of value added has been adjusted for each establishment in two respects. Value added now includes: (1) Value added by merchandising, i.e., the difference between the sales value and cost of merchandise sold without further manufacture, processing or assembly; and (2) an adjustment for the net change in finished goods and work-in-process inventories between the beginning and end of the year. The resulting figure is the adjusted value added. This procedure avoids the duplication in the "value of shipments" figures which results from the use of products of some establishments as materials by others. The "value added by manufacture" concept should not be confused with "national income originating in manufacturing," as presented in the national income estimates (see chapter F). The latter is obtained by subtracting from the value of shipments not only the cost of materials, but also such other costs as depreciation charges, State and local taxes (other than corporate income taxes), allowance for bad debts, and purchases of services from nonmanufacturing enterprises such as services of engineering and management consultants, advertising, telephone and

telegraph expense, insurance, royalties, patent fees, etc. It is, therefore, a more "net" concept of value added than that used in the census of manufactures. Value added by manufacture in 1967, for example, exceeded national income originating in manufacturing, as estimated by the U.S. Office of Business Economics, by 34 percent.

Robert E. Gallman prepared estimates of value added for the census years 1839 to 1879 by adjusting manufacturing totals to exclude nonmanufacturing industries and by correcting for industries omitted from or poorly covered by the various censuses. These estimates are extrapolations based on data prepared by Richard A. Easterlin and published in "Estimates of Manufacturing Activity," *Population Redistribution and Economic Growth, United States, 1870–1950*, vol. I, by Everett S. Lee, Ann Ratner, Carol P. Brainerd, and Richard A. Easterlin, American Philosophical Society, Philadelphia, 1957, pp. 635–681. The following are Gallman's estimates:

Table I. Value Added by Manufacture

[In millions of dollars]

Year	Current prices	Prices of 1879
1899	5,044	6,252
1889	3,727	4,156
1879	1,962	1,962
1869	1,631	1,078
1859	815	859
1849	447	488
1839	240	190

Source: Robert E. Gallman, "Commodity Output in the United States, 1839–1899," *Studies in Income and Wealth*, National Bureau of Economic Research, New York, 1961, vol. 24, table A 13.

P 11, capital expenditures, new. Manufacturers were asked to report expenditures made during the year for permanent additions and major alterations to their plants, as well as for new machinery and equipment purchases that were chargeable to fixed-asset accounts of manufacturing establishments and were of a type for which depreciation accounts are ordinarily maintained. Excluded are costs of maintenance and repairs charged as current operating expense, new facilities and equipment leased from other companies, new facilities owned by the Federal Government but operated under contract by private companies, and plant and equipment furnished to manufacturers by communities and organizations. Beginning 1951, the figures include expenditures for plants under construction and not yet in operation. (In the series by major groups, P 58–67, however, such expenditures are included beginning only in 1958.)

P 12, end-of-year inventories. Respondents were asked to report their inventories at approximate current costs if feasible; otherwise at book values. See also text for series P 74–92.

P 13. FRB index of manufacturing production, 1919–1970.

Source: Board of Governors of the Federal Reserve System, *Industrial Production, 1971 Edition*, S-45.

In the 1971 revision of the FRB industrial production index detailed adjustments were made to independently compiled Census-Federal Reserve benchmark and annual production levels for this series. All of the revisions have been carried back in detail to 1954 and in more limited fashion to 1939. The index comparison base has been updated to the single year 1967. Conversion to the new base has been carried back to the beginning of the index in 1919.

In this revision the manufacturing series was adjusted in detail to changes in the comprehensive Census-Federal Reserve production benchmarks for the years 1954 to 1958 and 1958 to 1963; the index had previously been adjusted to such benchmark changes for manufacturing from 1939 to 1947 and from 1947 to 1954. Where adequate product data were not available for the intervening years 1955–62 and for years 1964 through 1970, annual levels were adjusted to the detailed results of a new annual production index program for all 4-digit manufacturing industries based largely on deflated data from the Census Bureau's *Annual Survey of Manufactures*. Revised production levels for 1940 through 1946 are based on a combination of several types of independent annual data adjusted to the Census-Federal Reserve benchmark indexes from 1939 to 1947.

The year 1967 was selected for use as the weight base for the most recent period, beginning 1967. The year 1963 is used for the 1963–66 period, 1958 for the 1958–62 period, and 1954 for the 1954–57 period. The year 1947 continues to be used as the weight base for the 1947–52 period and 1939 weights have been introduced for the 1939–46 period.

For a more detailed description of the revised production series, see the source report of the *Federal Reserve Bulletin* for July 1971.

P 14. NBER index of manufacturing production, 1929–1966.

Source: John W. Kendrick, *Postwar Productivity Trends in the United States, 1948–1969*, National Bureau of Economic Research, New York, 1973, table A 32 (copyright).

The manufacturing output index is based on the Census-Federal Reserve Board (FRB) benchmark production indexes for 1947, 1954, 1958, and 1963, interpolated and extrapolated to 1966 by the FRB indexes of manufacturing production.

See also John W. Kendrick, *Productivity Trends in the United States*, National Bureau of Economic Research, 1961.

P 15–16. NBER index of manufacturing production, 1899–1919.

Source: U.S. Bureau of the Census, unpublished data.

These data were prepared by extending and shifting the production indexes originally prepared from census of manufactures data by Solomon Fabricant, National Bureau of Economic Research. The original data were first presented in Solomon Fabricant, *The Output of Manufacturing Industries, 1899–1937*, National Bureau of Economic Research, New York, 1940. These indexes cover only those years for which a census of manufactures was taken. Because of the inadequacy of data for most groups, no attempt was made to interpolate between intercensal years. For details of method of construction, see Fabricant's book, chapter 2 and appendix A.

P 17. Frickey index of manufacturing production, 1860–1914.

Source: Edwin Frickey, *Production in the United States, 1860–1914*, Harvard Economic Studies, Harvard University Press, 1947, p. 54.

In the derivation of these indexes, Frickey employed the weighted arithmetic mean of quantity relatives. With respect to weighting, he took the value-added principle as his standard and conformed to this standard as nearly as possible with existing data. For details on constituent series, see the source, appendixes A and B.

Making use of the figures for series P 13–17 and other data, John W. Kendrick has constructed an index of manufacturing, with 1929 as the base, for benchmark years 1869, 1879, and 1889, and annually thereafter through 1953. See appendix table D-II for figures and appendix D for description of this index in Kendrick's *Productivity Trends in the United States*, National Bureau of Economic Research, New York, 1961.

P 18–39. Indexes of manufacturing production (FRB), by industry group, 1947–1970.

II, parts 1, 2, and 3, table 1 for each major group; 1968–1970, *Annual Survey of Manufactures,* 1971. **Series P 67,** earliest year shown to 1929, *Fifteenth Census of the United States: 1939,* vol. II, Manufactures, 1929; 1939, *Census of Manufactures: 1954,* vol. II, parts 1 and 2; 1954 and 1962, *Census of Manufactures: 1963,* vol. I, pp. 6–10.

See general note for series P 1–374 and text for series P 1–12.

Food and kindred products. This group includes establishments manufacturing foods and beverages for human consumption and certain related products, such as manufactured ice, chewing gum, vegetable and animal fats and oils, and prepared feeds for animals and fowls. Also included are establishments primarily engaged in processing and distributing fluid milk and cream and those primarily engaged in extracting animal and vegetable oils.

Figures are not shown prior to 1921 because they are not sufficiently comparable with those for later years owing to numerous changes in classification.

Tobacco manufactures. This group includes establishments manufacturing cigarettes, cigars, smoking and chewing tobacco, and snuff, and stemming and redrying tobacco.

Textile mill products. This group includes establishments: (1) Manufacturing yarn, thread, cordage, and twine; (2) manufacturing woven fabric, carpets and rugs, braids, laces, knit fabric, knit garments, and other products from yarn; (3) dyeing and finishing fibers, yarn, and fabrics; and (4) coating, waterproofing, and otherwise treating fabric. Also included are establishments weaving or knitting fabrics and also manufacturing finished apparel or other fabricated textile products in the same establishment.

Apparel and other textile products. This group includes establishments producing clothing and fabricated products by cutting and sewing purchased woven or knit textile fabrics and related materials such as leather, rubberized fabrics, plastics and furs. Excluded from this group are knitting mills primarily engaged in manufacturing apparel from yarns knitted in the same establishment and weaving mills that further process the fabric at the same establishment into such end products as sheets, towels, and pillowcases, both of which are classified in textile mill products. Custom tailors and dressmakers, who manufacture and sell apparel in the same retail establishment, are classified as nonmanufacturing.

Three types of establishments are included in this group: (1) The regular factories or "manufacturers," (2) the apparel "jobbers," and (3) the contract factories or "contractors." The manufacturers purchase fabric, employ production workers in their own plants to cut and sew the materials into apparel, and sell the final product. The jobbers primarily perform entrepreneurial functions such as buying raw materials, designing and preparing samples, arranging for the manufacture of the garments from their materials, and selling of the finished apparel. The actual processing (cutting, sewing, etc.) is performed on contract by the apparel contractors, although many jobbers perform the cutting operation in their own establishments. Apparel jobbers are included in manufacturing. However, jobbers of miscellaneous fabricated textile products, such as curtains, draperies, etc., are classified in wholesale trade.

Lumber and wood products. This group includes logging camps cutting timber and pulpwood, merchant sawmills, lath mills, shingle mills, cooperage-stock mills, planing mills, and plywood mills and veneer mills producing lumber and wood basic materials; and establishments manufacturing finished articles made entirely or mainly of wood or wood substitutes. See also furniture and fixtures and miscellaneous manufacturing.

Woodworking in connection with construction, in the nature of reconditioning and repair, or performed to individual order, is classified in nonmanufacturing.

Furniture and fixtures. This group includes establishments manufacturing household, office, public building, and restaurant furniture; and office and store fixtures. Establishments primarily engaged in woodworking to individual order or in reconditioning and repair are classified in nonmanufacturing.

Paper and allied products. This group includes the manufacture of pulps primarily from wood, and from rags and other cellulose fibers; the conversion of these pulps into paper or board; and the manufacture of paper and paperboard into converted products such as coated paper, paper bags, paperboard boxes, and envelopes. Certain types of converted paper products—such as abrasive paper, carbon paper, and photo-sensitized and blueprint paper—are classified in other groups.

Printing and publishing. This group includes establishments engaged in printing, such as letterpress, lithography, gravure, or screen; establishments which perform printing services such as bookbinding, typesetting, engraving, photoengraving, and electrotyping and establishments publishing newspapers, books, and periodicals, regardless of whether or not they do their own printing. News syndicates are classified in service industries, and textile printing and finishing in textile mill products. Prior to 1935, data reported by religious, social, charitable, educational, and other nonprofit organizations are not included; thereafter, data are included only for such nonprofit organizations whose employees are covered by the Social Security system.

Chemicals and allied products. This group includes establishments producing basic chemicals, and establishments manufacturing products by predominantly chemical processes. Establishments classified in this group manufacture three general classes of products: (1) Basic chemicals such as acids, alkalies, salts, and organic chemicals; (2) chemical products to be used in further manufacture such as synthetic fibers, plastics materials, dry colors, and pigments; and (3) finished chemical products to be used for ultimate consumption, such as drugs, cosmetics, and soaps, or to be used as materials or supplies in other industries, such as paints, fertilizers, and explosives. Establishments primarily packaging, repacking, and bottling purchased chemicals and allied products are classified in trade industries.

Petroleum and coal products. This group includes establishments primarily engaged in petroleum refining, manufacturing paving and roofing materials, and compounding lubricating oils and greases from purchased materials. Establishments manufacturing and distributing gas to consumers are classified in public utilities industries, and those primarily engaged in producing coke and byproducts in primary metal industries. Establishments primarily engaged in producing crude petroleum, natural gas, natural gasoline, and cycle condensation are classified in mining industries.

Rubber and plastics products, not elsewhere classified. This group includes establishments manufacturing from natural, synthetic, or reclaimed rubber, gutta percha, balata, or gutta siak, rubber products such as tires, rubber footwear, mechanical rubber goods; heels and soles, flooring, and rubber sundries. It also includes establishments manufacturing or rebuilding retreaded tires, but automobile tire repair shops engaged in recapping and retreading automobile tires are classified in services. This group also includes establishments molding primary plastics for the trade and manufacturing miscellaneous finished plastics products. Elastic webbing, products made of elastic webbing and garments made from rubberized fabrics, synthetic rubber, and plastics materials in the form of sheets, rods, tubes, granules, powders, and liquids are classified elsewhere.

Leather and leather products. This group includes establishments tanning, currying, and finishing hides and skins; establishments manufacturing finished leather and artificial leather products and some

similar products made of other materials; and leather converters.

Stone, clay, and glass products. This group includes establishments manufacturing flat glass and other glass products, cement, structural clay products, pottery, concrete, and gypsum products, cut-stone products, abrasive and asbestos products, etc., from materials taken principally from the earth in the form of stone, clay, and sand. When separate reports are available for mines and quarries operated by these establishments, the mining activities are classified in mining industries; otherwise, the mining activities are classified here.

Primary metal industries. This group includes establishments smelting and refining ferrous and nonferrous metals from ore, pig, or scrap; rolling,drawing, and alloying of ferrous and nonferrous metals; manufacturing castings, forgings, and other basic products of ferrous and nonferrous metals; and manufacturing nails, spikes, and insulated wire and cable. It also includes the production of coke.

Figures are not shown prior to 1937 because of large elements of noncomparability in the earlier statistics of a number of the industries included.

Fabricated metal products. This group includes establishments primarily manufacturing a wide variety of fabricated metal products. Other important segments of the metal fabricating industries are classified in machinery, transportation equipment, instruments and related products, furniture and fixtures, and miscellaneous manufacturing industries.

The industries included here encompass a varied group of finished products (cutlery, hardware, oil burners, plumbing fixtures, metal doors, safes, etc.), materials or components for incorporation into other products (sheet metal work, steel springs, bolts and nuts, etc.), containers (metal cans, metal shipping barrels and drums, and collapsible tubes), and service operations performed on a job or order basis for the trade (for example, galvanizing, coating, and engraving).

Figures are not shown prior to 1937 because they are not sufficiently comparable with those for later years principally owing to the inclusion in earlier years of establishments primarily manufacturing valves and fittings, except plumbers', and the exclusion of establishments primarily manufacturing stamped, pressed, and spun aluminum ware.

Machinery, except electrical. This group includes establishments primarily producing a wide variety of machinery and equipment items. The industries included encompass the whole range of industrial machinery, other than electrical. To a considerable extent, the products fall into the producers' heavy equipment category, are frequently of a complex character, and are produced both to individual order and as standard items. Industries in some of the subgroups are defined in terms of end products, and the parts, attachments, and accessories for these items are included in the industry of the end product unless specifically classified elsewhere in the Standard Industrial Classification. The volume of shipments of machinery parts and accessories in some industries constitutes a significant portion of total shipments. These parts producers are generally smaller establishments but there are a large number of them. The machine shops subgroup includes plants producing a broad variety of miscellaneous parts made by job machine shops.

Plants primarily rebuilding machinery or equipment on a factory basis were formerly included in this group. However, such rebuilding activities are now classified according to the original industry classification of the product being rebuilt. Plants primarily rebuilding automotive parts are included in the transportation equipment group. Plants primarily rebuilding machine tools, metalworking machinery, and office and store machines are included in the industry of the plants producing the original equipment.

Figures are not shown prior to 1937 because they are not sufficiently comparable with those for later years, owing principally to their inclusion of establishments primarily engaged in manufacture of aircraft engines and in machine shop repairs.

Electrical equipment and supplies. This group covers establishments primarily manufacturing machinery, apparatus and supplies for the generation, storage, transmission, transformation, and utilization of electrical energy. Products included consist of equipment and apparatus for industrial or commercial use as well as goods for household consumption—for example, electric lamps, lighting fixtures, wiring devices and supplies, ranges, ovens, water heaters, fans and small electric appliances, household refrigerators and freezers, household laundry equipment, sewing machines, and vacuum cleaners.

A number of products which are sometimes considered "as belonging" in electrical equipment are classified in other groups in the 1957 edition of the *SIC Manual* in use for 1963. For example, machinery or equipment powered by built-in or detachable electric motors, such as machine tools and other metalworking equipment, commercial laundry and dry cleaning equipment, industrial vacuum cleaners, and office and store machines are classified as machinery, except electrical. Establishments primarily producing glass insulators, glass blanks for bulbs, and porcelain electrical supplies are classified in the stone, clay, glass, and concrete products group.

Industries included here are typically defined in terms of products and may include both electrical and electronic equipment. Electronic components are frequently produced and consumed at the same location by establishments classified in this group. Thus, there are (1) plants solely engaged in producing electronic components, (2) plants producing electronic components and assembling them into finished products, and (3) plants which assemble components produced elsewhere either in other plants of the same company or by other companies. Other types of components and equipment such as motors, generators, and motor-generator sets are not uncommonly produced for incorporation into other products made in the same plant.

Transportation equipment. This group covers establishments primarily manufacturing equipment for transportation of passengers and cargo by land, air, and water. Important products include motor vehicles, aircraft, ships, boats, railroad equipment, and miscellaneous transportation equipment such as motorcycles, bicycles, etc. It also includes, since 1967, guided missile components, not elsewhere classified; and receipts from research and development on aircraft parts, guided missile components, not elsewhere classified, and airplane and missile engines.

Certain products sometimes associated with or considered a part of transportation equipment are classified in other groups in the SIC. For example, wheeltype tractors, tracklaying tractors, mining cars, and industrial trucks, tractors, trailers, and stackers are classified as machinery, except electrical; and ignition systems and storage batteries as electrical equipment and supplies.

Railroad shops are not classified as manufacturing by the SIC and, therefore, such activities are not included in employment and other establishment totals for this group.

Figures are not shown prior to 1937 because they are not sufficiently comparable with later years owing to their exclusion of establishments primarily engaged in manufacture of aircraft engines and of a number of large establishments classified prior to 1937 in other industry groups.

Instruments and related products. This group covers establishments primarily manufacturing mechanical measuring, engineering, laboratory, and scientific research instruments; optical instruments and lenses; surgical, medical, and dental instruments, equipment, and supplies; ophthalmic goods; photographic equipment and supplies; and watches and clocks. Establishments primarily manufacturing instruments for indicating, measuring, and recording electrical quantities and characteristics are classified in electrical equipment and supplies.

During 1958 to 1963, reports received from some large establishments indicated a change from the manufacture primarily of such individual instruments as those used for indicating air speed, rate-of-climb, angle-of-yaw and similar flight characteristics, and gyroscopes which are sold separately, to the manufacture primarily of complete instrumentation systems for navigation, guidance, check-out etc. The major impact of this change has been on the classification of products and, consequently, the SIC coding of these large establishments.

As a result, the annual data for 1958–1962 were revised. Because of the shift in recent years from instruments classified in this group to complete systems classified in the electrical equipment and supplies group, the year-to-year changes are of dubious validity for the industries

considered separately. The two industries taken in combination however, would yield significant measures of activity in the general area.

Miscellaneous manufacturing industries. This group covers establishments primarily manufacturing products not classified in any other group. Industries in this group fall into the following categories: Jewelry, and silverware and plated ware; musical instruments; toys, and sporting and athletic goods; pens, pencils, and other office and artists' materials; buttons, costume novelties, and miscellaneous notions; brooms and brushes; morticians' goods; and other miscellaneous manufacturing industries.

For 1953 and earlier years, data for ordnance and accessories are included with this group. For 1954 and subsequent years data for the ordnance and accessories group are published separately in the source volumes.

Figures are not shown prior to 1947 because they are not sufficiently comparable with those for later years owing to their exclusion of establishments primarily manufacturing rubber dolls, carousels and other amusement park rides, electric vibrators, exercisers and reducers, blasting and detonating caps, safety fuses, and pressed and molded pulp goods; and inclusion of establishments primarily manufacturing cellophane bags, aluminum tags, and hair clippers for human use.

P 68–73. Horsepower of power equipment in manufacturing industries, 1869–1962.

Source: U.S. Bureau of the Census, *Census of Manufactures, 1963*, vol. I, p. 6–9.

The first census of power equipment available in manufacturing establishments was made by the Bureau of the Census in 1870 covering the year 1869. Because certain industries included in earlier censuses were not covered by the 1939 census, the power equipment statistics from 1899 through 1929 were adjusted in 1939 to provide a comparable series for the 70-year period. The comparability of the 1954 and 1962 statistics with those for 1939 is affected by (a) the exclusion from the 1954 and 1962 inquiry of fractional horsepower motors included in the 1939 totals, and (b) the omission of data for selected industry groups in 1954 included in the 1939 and 1962 totals.

The aggregate horsepower figure, series P 68, represents the unduplicated rating for total installed equipment and thus provides a measure of the mechanical power available in manufacturing establishments. The figure is derived by summing the horsepower rating of prime movers, series P 69, and that for electric motors driven by purchased electricity, series P 71. To secure the latter figure the total horsepower for electric motors was distributed, by establishment, into two categories: Motors driven by purchased electricity and motors driven by energy generated at the establishment. For the relatively small number of establishments which both generate and purchase electricity, the total horsepower for electric motors was prorated on the basis of the ratio of the net quantity purchased to the net total for electricity consumed.

The horsepower ratings for prime movers include information for such types of power equipment as internal combustion engines, steam and hydraulic turbines, and reciprocating steam engines. The totals for prime movers are further separated between those driving electric generators and those used for other purposes. The statistics for prime movers not driving generators exclude data for automobiles, trucks, and other highway equipment.

Respondents were requested to report horsepower of standby equipment as well as equipment in operation at the end of the year, including all prime movers and motors in mobile (except automobiles, trucks, and other highway equipment) as well as in stationary equipment. Information for fractional horsepower motors, however, was not reported for either 1954 or 1962.

Data on aggregate horsepower per 100 (factory) production workers, series P 73, are comparable for all years, except for 1954 and for years prior to 1899. The figures for 1954 exclude data for all establishments in the printing trade services industry, and those in the apparel and other fabricated textile products industry except for miscellaneous apparel. The number of wage earners as published in the census reports prior to 1899 includes those in factory as well as in hand trades and neighborhood industries (carpentry, millinery, painting, etc.) and custom grist milling, custom saw milling, and cotton ginning. Changes in the minimum size limit set for establishments included in the several censuses, or the number of manufacturing establishments requested to report power equipment data are believed to have an insignificant effect on the totals.

P 74–92. Value of manufacturers' shipments, inventories, and orders, 1947–1970.

Source: U.S. Bureau of the Census, *Manufacturers' Shipments, Inventories, and Orders: 1947–1963 Revised, 1961–1968*, and *1966–1972 Revised*, series M 3–1.

Shipments, as used here, represents manufacturers' receipts, billings, or the value of products shipped, less discounts, returns, and allowances, and exclude freight charges and excise taxes. Shipments for export as well as for domestic use are included. Shipments by foreign subsidiaries are excluded, but shipments to a foreign subsidiary by a domestic firm are included. The shipments figures from the Annual Survey of Manufactures to which this series is benchmarked include interplant transfers as well as commercial sales.

Inventory data are book values of stocks on hand at the end of the period, and include materials and supplies, goods in process, and finished goods. Inventories associated with nonmanufacturing activities are excluded from the benchmark. In general, inventories are as valued by the manufacturer.

New orders are net of cancellations received during the period. Unfilled orders at the end of a reporting period are orders that have not passed through the sales account and are equal to unfilled orders at the beginning of the period plus net new orders received during the period less net sales.

The manufacturers' shipments, inventories, and orders survey provides monthly figures that are comparable to the annual totals published each year in the annual survey of manufactures. The sample panel is defined as a probability sample drawn as a subsample of the companies with 100 or more employees in the annual survey of manufactures. The monthly reporting panel consists of approximately 5,000 reporting units and includes virtually all companies with 1,000 or more employees and a sample of the smaller ones.

P 77–86, inventories. Respondents are asked to report inventories of individual establishments at approximate current cost if feasible; otherwise, "at book values." Since different methods of inventory valuation are used, the definition of the aggregate inventories for establishments in an industry is not precise. The figures on the change in inventories from one period to the next are of greater significance than the actual aggregates.

Inventories are reported by stage of fabrication: (a) Finished goods; (b) work in process; and (c) materials, supplies, fuel, and other inventories. In using inventories by stage of fabrication at the all manufacturing level, as well as for the durable and nondurable goods sectors, it should be noted that a finished product of one industry may be a raw material for another industry at the next stage of fabrication.

P 87–92, new orders and unfilled orders. Orders are net of cancellations. They include orders received during the period and also filled during the period as well as orders received for future delivery. They also include the net sales value of contract change documents which increase or decrease the sales value of the unfilled orders to which they relate. Orders include only those supported by binding legal documents such as signed contracts, letters of award, or letters of intent. In case of letters of intent, the full amount of the sales value is included if the parties are in substantial agreement on the amount; otherwise, only the funds specifically authorized to be expended are included.

Unfilled orders include orders as defined above that have not yet passed through the sales account. Generally, unfilled orders at the end

of the reporting period are equal to unfilled orders at the beginning of the period plus net new orders received less net sales.

While both new orders and unfilled orders are used in reviewing individual company reports for consistency, only unfilled orders are estimated directly in the tabulated totals. New orders are derived from the shipments plus net change in unfilled orders for each industry category.

P 93–106. Manufacturing corporations—sales, profits, and stockholders' equity, 1947–1970.

Source: U.S. Council of Economic Advisers, *Economic Report of the President*, January 1972, table B–74.

Data are from the U.S. Federal Trade Commission and U.S. Securities and Exchange Commission. The annual figures presented here appear originally in the Federal Trade Commission's *Quarterly Financial Report for Manufacturing Corporations* for the fourth quarter of the year.

These data are based on uniform, confidential financial statements collected from a probability sample of all enterprises which are required to file Form 1120, U.S. Corporation Income Tax Return, and are classified as manufacturers. Included are domestic corporations organized within the United States, resident foreign corporations incorporated abroad but engaged in trade or business in the United States, associations and joint-stock companies which are taxed as corporations, and small business corporations electing to be taxed through their shareholders. Excluded are inactive corporations with no income or deductions, tax-exempt farmers' cooperatives, tax-exempt nonprofit organizations, and corporations not classified in their tax returns as manufacturers.

The first sample was drawn from Form 1120 for the taxable year 1943. A second sample was drawn for the taxable year 1949. The third sample was drawn for the taxable year 1954 and each taxable year thereafter. Each sample has been supplemented by a quarterly sample of applications for a Federal Social Security Employer's Identification Number filed with the the Social Security Administration.

The first sample was used to provide estimates for each of the quarters in calendar years 1947 to 1951, inclusive; the second sample, from third quarter 1951 to second quarter 1956, inclusive; the third sample, from second quarter 1956 to 1970. To splice the estimates based upon the first and second samples, an overlap was provided for third and fourth quarters 1951; the second and third samples, an overlap was provided for second quarter 1956. Within the third sample, an overlap was provided for each quarter in calendar year 1958 to splice the estimates based upon the 1945 and 1957 editions of the *Standard Industrial Classification Manual (SIC)*.

The classification of a corporation has been determined, in general, on the basis of the consolidated operations of the reporting company (as opposed to the establishment). In the reports for 1947 through 1958, classification was based on the 1945 edition of the SIC manual. Beginning 1959, estimates were based on the classification of corporations within the framework of the 1957 edition. In 1963, the *Enterprise Standard Industrial Classification* (ESIC) was used in the classification of companies. The structure of the 1968 revision of the ESIC follows closely that of the 1967 edition of the SIC.

For further description concerning compilation of these series, see Federal Trade Commission, *Quarterly Financial Report for Manufacturing Corporations*. Specific information concerning significant changes and revisions is contained in the following issues of the *Report*: Third quarter 1953, third quarter 1956, first quarter 1959, and first quarter 1965.

P 107–112. Purchases of structures and equipment, in manufacturing industries, 1863–1970.

Source: U.S. Bureau of Economic Analysis, *Fixed Nonresidential Business Capital in the United States, 1925–1973*, National Technical Information Service, Springfield, Va., January 1974, pp. 425–427 and 437–439; and unpublished data.

Private purchases of structures and equipment for manufacturing establishments were derived from the estimates of gross private domestic investment in new industrial buildings and producers' durable equipment that are included in the gross national product estimates of the Department of Commerce. The outlays on structures and equipment were adjusted to benchmarks based on expenditures for new plant and equipment in the census of manufactures for 1939, 1947, 1954, 1958, 1963, and 1967, and the annual survey of manufactures for other years beginning with 1950 and ending with 1966. The census controls were extended through 1970 by data from plant and equipment expenditure surveys conducted jointly by the Bureau of Economic Analysis (formerly Office of Business Economics) and the Securities and Exchange Commission.

The purchases of structures and of equipment were converted to constant (1958) cost by the indexes used to deflate the corresponding individual series in the gross national product.

For a more detailed discussion and for tabulations derived from these and related series, see source.

P 113–118. Depreciation (straight-line) on manufacturing structures and equipment, 1925–1970.

Source: See source for series P 107–112, pp. 7–9 and 50.

Information on the service lives of capital assets is deficient. Not enough is known either about the average service lives of the producers' durable equipment and structures that make up the stock of fixed capital, or about how the service lives of individual items depart from average. Differences in the basic physical characteristics of capital assets, variations among the practices of their owners with respect to use and retirement, technological changes and changes in demand, all make for a large dispersion of service lives and help to explain the dearth of information about them. The useful life information was drawn largely from *Income Tax, Depreciation and Obsolescence, Estimated Useful Lives, and Depreciation Rates*, Bulletin F, Internal Revenue Service. The actual service lives used were 85 percent of Bulletin F for equipment, and 68 percent of Bulletin F for structures. (See pages T-4 and T-5 of source for reasons behind the use of shorter service lives.)

Average service lives were estimated for each of the 20 types of equipment and 10 types of structures which are detailed in the GNP gross investment series with which the calculation starts. Average life for each type of nonfarm equipment was derived by assigning service lives as shown in Bulletin F to each of the equipment items of that type and deriving an average for the type for each year based on weights reflecting shipments of each item as shown in the censuses and annual surveys of manufactures. Altogether, Bulletin F service lives for about 180 items of equipment were used in obtaining averages for the 20 types. Average lives for farm equipment were derived from several unpublished Department of Agriculture studies.

Depreciation at constant cost has been estimated by applying information on the length of useful lives to the constant dollar purchases of structures and equipment.

Underlying the average service life of a given type of asset is a distribution of discards. For example, trucks have an average service life of 10 years, but some trucks are wrecked after a few months and others are used for 15 or 20 years. To take into account that similar assets are discarded at different ages, a pattern labeled the Winfrey S-3 distribution was introduced. It is a minor modification of the original Winfrey S-3 curve. (See Robley Winfrey, *Statistical Analysis of Industrial Property Retirement*, Iowa Engineering Experiment Station Bulletin 125, Dec. 11, 1935.) The new pattern is a bell-shaped distribution whose mean is the average service life of the asset in question, with discards starting at 45 percent of the average life and continuing until 155 percent of the average life has been attained. In the absence of sufficient information to support any alternative course,

that service life distribution was applied uniformly to all the gross investment series to derive the gross capital stocks and related estimates.

P 119–122. Real net value of assets in manufacturing industries, in 1958 dollars, 1925–1970.

Source: See source for series P 107–112, pp. T-25, 286, 287, and 397.

Estimates are for privately owned structures and equipment assets in manufacturing establishments (in contrast to the firm), and represent the undepreciated value remaining in past acquisitions including the purchases of Government surplus assets at original acquisition prices. The latter were derived from the estimates of gross private domestic investment in newly constructed nonresidential structures and producers' durable equipment that are included in the gross national product estimates of the Department of Commerce. The outlays on structures were adjusted to benchmarks, based mainly on expenditures for new plant construction by establishments included in the census of manufactures. Data on gross investment by manufacturing establishments from censuses and annual surveys of manufactures were used as industry totals. The asset detail was developed on the basis of unpublished Internal Revenue Service studies on lives of depreciable assets and several specialized industry studies which provided detailed information on the composition of assets in manufacturing. Purchases of equipment were converted to constant (1958) cost by the indexes used to deflate the corresponding component of the gross national product. Purchases of structures were deflated by constant cost 2, which is a closer approximation to a price index than is constant cost 1. For the composition of these costs, see table 4, pp. T-17 to T-19 of source.

Depreciation was allocated over the useful life by the double-declining balance method, under which twice the straight-line rate of depreciation is charged in the first year, and the same percentage rate is applied in successive years to the remaining value of the asset. (See page T-12 of source.)

For a discussion of the data and methodology of estimation of Government-owned, privately operated assets for each of the four major owning agencies—Department of Defense, Atomic Energy Commission, Maritime Administration, and National Aeronautics and Space Administration—see pages T-22 and T-23 of source.

P 123–176. Capital in manufacturing industries, in book value and in 1929 dollars (Creamer), 1879–1957.

Source: 1879–1937, Daniel Creamer, Sergei Dobrovolsky, and Israel Borenstein, *Capital in Manufacturing and Mining: Its Formation and Financing*, Princeton University Press, 1960, Appendix A, tables 8 and 9; 1948–1957, Daniel Creamer, *Capital Expansion and Capacity in Postwar Manufacturing*, National Industrial Conference Board, Inc., New York, *Studies in Business Economics*, No. Seventy-Two, 1961, Appendix G, tables G-1 and G-2. (Copyright.)

Estimates for 1879–1919 are based on data in various reports of the census of manufactures. For 1929–1957, the estimates are based on balance sheet data of corporations (raised to the level of all firms) published by the Internal Revenue Service (formerly Bureau of Internal Revenue) in *Statistics of Income*. Fixed capital includes land, buildings, and equipment (all net of depreciation). Working capital includes all other assets, other than investments in securities (chiefly cash, accounts and notes receivable, and inventories). Structures and equipment owned by the Federal Government but operated by private firms are excluded in all years. For a detailed description of data, adjustments and limitations, see Appendix A, section A, of the first source.

Figures in 1929 dollars were derived by dividing the estimates of capital in book values, by price indexes of book values expressed in 1929 prices. The latter are the implicit indexes derived by dividing the sum of the reported book values of the 15 major industry groups comprising all manufactures by the sum of the book values expressed in 1929 prices of the 15 major groups.

The general procedure for deflating capital is to derive a composite index of prices underlying book values of buildings, machinery and equipment, and working capital for each of the 15 major industrial groups shown here. A construction cost index weighted by volume of construction depreciated over 50 years is used to represent the changes in the book value of land and buildings. This component of the composite index is identical for all 15 groups. For machinery and equipment, a price index of general machinery and equipment is used for all 15 groups, but in each group the index is weighted by volume of machinery and equipment produced, depreciated according to length of life typical for a given industry as reported by the Internal Revenue Service in *Income Tax, Depreciation and Obsolescence, Estimated Useful Lives, and Depreciation Rates*, Bulletin F. Because of these changing industry weights, a different deflator for machinery and equipment is obtained for each major group. The wholesale price index of the output of a given major industry is used to deflate working capital.

For derivation of the deflators for each of the 15 major groups, see Appendix A, section B, of the first source.

P 177–196. Share of total value added by manufacture accounted for by the 200 largest manufacturing companies, and by the 50 and 100 largest identical manufacturing companies, 1947–1970.

Source: U.S. Bureau of the Census. 1947–1967, *1967 Census of Manufactures*, vol. I, p. 9–6; 1970, Annual Survey of Manufactures, *Value of Shipment Concentration Ratios*, M70 (AS)-9.

Data for 1962 and 1966 are based on the annual survey of manufactures; other years on the census of manufactures.

These data reflect the activity of the largest companies in the industrial sector as a whole. A company is defined as the total of its industrial establishments, including not only its manufacturing plants but also auxiliary establishments such as warehouses and central administrative offices. Value added for all manufacturing establishments of a given company was aggregated irrespective of the industry classification of the individual establishments. The companies were then arrayed by magnitude of value added in each specified year and totals were computed for the 50, 100, 150, and 200 largest companies.

The rankings in 1947 and 1954 were based on unadjusted value added; those for later years on adjusted value added. See text for series P 10.

For series P 177–180, companies were classified in size groups in each particular year based on their size in that year. The largest companies are those which were the largest in each of the specified years. Thus, a size group, such as the top four, does not necessarily include the same companies from year to year.

For series P 181–196, the 100 largest companies in each year specified in the stub of the table were selected and their proportion of total value added by manufacture in each of the years shown in the column headings was computed. These data thus measure the changes in concentration ratios for a fixed group of companies from one year to another. In case of mergers, the larger of the two at the time of merger was considered to be the predecessor company.

P 197–204. Concentration in manufacturing, by industry group, 1901, 1947, and 1954.

Source: **Series P 197**, G. Warren Nutter, *The Extent of Enterprise Monopoly in the United States*, tables 10 and 39, copyright 1951 by The University of Chicago. **Series P 198**, M. A. Adelman, "The Measurement of Industrial Concentration," *Review of Economics and Statistics*, vol. 33, November 1951, table 14 (copyright, Harvard College; based on *Hearings Before the Subcommittee on Study of Monopoly Power*, House of Representatives, 81st Congress, 1st session, Serial No. 14, part 2-B, pp. 1436–1456). **Series P 199–200** are tabulations prepared by the Bureau of the Census from data reported in the census of manufactures. **Series P 201–204**, Irving Rottenberg, "New Statistics

on Companies and on Concentration in Manufacturing From the 1954 Census," *Proceedings of the American Statistical Association*, 1957, table 5 (copyright).

The basic source of most of the data in all columns is the census of manufactures. The concentration ratio is defined as the percent of total industry sales (or, occasionally, value added) made by the four largest sellers.

The entries for series P 197–198 represent the value added by manufacture in 4-digit SIC industries (see general note for series P 1–374) with concentration ratios of 50 or higher, as a percentage of value added by all 4-digit industries included in each 2-digit industry group (e.g., "food and kindred products" is a 2-digit group containing "meatpacking plants" and 2 other 4-digit meat industries, "creamery butter" and 5 other 4-digit dairy industries, etc.).

The figures for series P 199–204 are average concentration ratios for each 2-digit industry group, i.e., the concentration ratio of each 4-digit industry is weighted in proportion to its employment or value added, as indicated, as a proportion of total employment or total value added by the whole 2-digit group.

Series P 199–200 include all industries for the given year—452 in 1947, and 434 in 1954. Because of changes in 4-digit industry definitions, concentration ratios are not fully comparable. Series P 201–204 are based on 375 comparable industries accounting for 85 percent of all value added by manufacture in 1947, and for 82 percent in 1954.

The first total line is a set of weighted averages based on value-added weights derived from the basic data for the respective years shown. Figures on the second total line (for series P 201–204) are averages of the concentration ratios shown for the 20 industry groups.

Where the change in concentration, 1947–1954, as shown in series P 199–200, is substantially different from that shown in series P 201–204, the difference is due to industry redefinition and to inclusion or exclusion of industries from the census of manufactures. A striking example is in group 39, "miscellaneous manufactures" from which major group 19, "ordnance and accessories," was omitted for national security reasons.

P 205–211. Selected statistics for operating manufacturing establishments, by legal form of organization, 1939–1967.

Source: U.S. Bureau of the Census, 1939, *Sixteenth Census of the United States: 1940, Census of Manufactures, 1939*, vol. I, p. 230; 1947–1967, *1967 Census of Manufactures*, vol. I, p. 3–4.

Each establishment included in the censuses of manufactures was classified into one of the following legal forms of organization:

Corporate—an establishment (other than a cooperative) owned by an organization or company legally incorporated under State laws.

Noncorporate—individual proprietorships, partnerships, cooperatives, establishments operated by estate administrators, trusteeships, receiverships, public and quasi-public organizations, and, in addition, misassignments of small establishments that were not corrected because they were not statistically significant.

Individual proprietorship—an establishment owned by one person, who may or may not actively participate in the operation of the business.

Partnership—an establishment owned by two or more persons, each of whom has a financial interest in and responsibility for the business. A partner may or may not actively participate in the operation of the business.

See also text for series P 1–12.

P 212–215. Percent distribution of production workers and of value added in manufacturing establishments, by legal form of ownership, 1899–1967.

Source: U.S. Bureau of the Census. 1899, *Census of Manufactures: 1905*, part I, p. liv; 1904 and 1909, *Thirteenth Census of the United States, 1910, Manufactures: 1909*, vol. VIII, p. 135; 1914 and 1919, *Fourteenth Census of the United States, 1920, Manufactures: 1919*, vol. VIII, p. 108; 1929, *Fifteenth Census of the United States, 1930, Manufactures: 1929*, vol. I, p. 95; 1939, *Sixteenth Census of the United States, 1940, Manufactures: 1939*, vol. I, p. 229; 1947–1967, *U.S. Census of Manufactures, 1967*, vol. I.

Percentages were computed from figures published in the various Bureau of the Census reports cited as sources.

See also data and text for series P 205–211.

P 216–226. Consumption of energy materials, 1899–1967.

Source: U.S. Bureau of the Census. *Thirteenth Census of the United States: 1910*, vol. X, p. 662; *Census of Manufactures: 1963*, vol. I, pp. 7–90 and 7–91; and *Census of Manufactures: 1967*, Special Report MC67(S)-4, *Fuels and Electric Energy Consumed*, pp. 8–9.

Data for fuels consumed for heat and power were converted to kilowatt-hour equivalents, the international unit of energy, and then added to the quantity of purchased electric energy. The conversion factors used for each fuel are shown in the source reports. For fuels, quantities include both fuels purchased for use as fuel and fuels made and used in the same establishment.

P 227. Coffee imported, 1860–1970.

Source: 1860–1914, see source for series P 17, pp. 8–9 and 143–144; 1915–1929, see Arthur F. Burns, pp. 292–293, cited as source for series P 231; 1930–1947, U.S. Bureau of the Census, *Foreign Commerce and Navigation of the United States;* 1948–1962, same agency, *Quarterly Summary of Foreign Commerce of the United States*, for those years; 1963–1970, same agency, *U.S. Imports of Merchandise for Consumption*, Reports FT 110, FT 125, and FT 135, calendar year issues.

The data for 1860–1933 are described as net imports (general imports) minus foreign exports; for 1934–1970, they are described as imports for consumption minus foreign exports. However, on duty-free commodities, like coffee, general imports equal imports for consumption. Data cover U.S. customs area, which includes Alaska, Hawaii, and Puerto Rico.

P 228. Raw cotton used in textiles, 1860–1970.

Source: U.S. Bureau of the Census. 1860–1909, *Bulletin 160, Cotton Production and Distribution, 1926*, p. 49; 1910–1945, *Bulletin 183, Cotton Production and Distribution, 1946*, pp. 26–31; 1946–1962, *Cotton Production and Distribution*, annual reports; 1963–1970, Current Industrial Reports, series M22P, *Cotton, Man-Made Fiber Staple, and Linters, Summary for Cotton Season*, various annual issues.

Data are for years ending August 31 through 1910, July 31 thereafter. Figures are in running bales, except that for 1860–1870, they are in equivalent 500-pound bales. Data exclude linters for 1860–1908 and include them thereafter.

P 229. Wool used in textiles, 1918–1970.

Source: U.S. Bureau of the Census. 1922–1957, *Facts for Industry, Wool Consumption and Stocks*, monthly issues. (Title may vary for this report.) 1958–1970, Current Industrial Reports, series M 220, *Consumption on the Woolen and Worsted Systems*, monthly issues.

Figures relate to scoured wool plus greasy wool reduced to a scoured basis, assuming average yields varying with class, origin, grade, and whether shorn or pulled. For 1946–1970, they include raw wool consumed in woolen and worsted systems only.

For a series on apparent consumption of all wool, 1870–1929, see Arthur F. Burns, pp. 296–297, cited as source for series P 231.

P 230. Unmanufactured silk imports for consumption, 1883–1970.

Source: 1883–1929, see Arthur F. Burns, pp. 294–295, cited as source for series P 231; 1930–1931, U.S. Bureau of Foreign and Domes-

tic Commerce, *Foreign Commerce and Navigation of the U.S.*, vol. I, for respective years; 1932, U.S. Bureau of the Census, *Statistical Abstract of the United States, 1940*, p. 732; 1933–1949, *Statistical Abstract, 1950*, p. 638; 1950–1955, Textile Economics Bureau, Inc., New York, *Textile Organon*, vol. XXXVII, No. 3, March 1966; 1955–1970, *Textile Organon*, March 1971.

Figures are derived by subtracting foreign exports from general imports of all types of unmanufactured silk. Spun silk is not included.

For a series on raw silk imports (excluding silk from cocoons and waste) for 1860–1914, see source for series P 17, pp. 8–9 and 153–155; and for 1870–1929, see Arthur F. Burns, cited above.

P 231. Wheat flour produced, 1860–1970.

Source: 1860–1914, see source for series P 17, pp. 8–9 and 135–139; 1915–1929, Arthur F. Burns, *Production Trends in the United States Since 1870*, National Bureau of Economic Research, New York, 1934, pp. 299 and 339 (copyright); 1931 and 1933, Solomon Fabricant, *The Output of Manufacturing Industries, 1899–1937*, National Bureau of Economic Research, New York, 1940, p. 395 (copyright; data from census of manufactures); 1935–1970, U.S. Dept. of Agriculture, Economic Research Service, Agricultural Economic Report No. 138, *Food Consumption, Prices, and Expenditures*, and Supplement for 1970.

Reported data in hundredweights were converted to barrels containing 196 pounds of flour. These estimates are based on commercial production of wheat flour reported by the Bureau of the Census. They include flour milled in bond from foreign wheat plus the estimated flour equivalent of farm wheat ground for flour or exchanged for flour for farm household use.

P 232. Refined sugar produced, 1860–1970.

Source: 1860–1914, see source for series P 17, pp. 8–9 and 139–143; 1919–1933, see Solomon Fabricant, pp. 382 and 387, cited as source for series P 231; 1934–1945, U.S. Department of Agriculture, *Agricultural Statistics, 1952*, p. 111; 1946–1960, *Agricultural Statistics, 1967*, p. 83; 1961–1970, *Agricultural Statistics, 1971*, p. 88.

Figures represent production in cane-sugar refineries and in beet-sugar factories.

P 233. Canned corn produced, 1885–1970.

Source: 1885–1908, see Arthur F. Burns, pp. 300–301 and 341, cited as source for series P 231; 1909–1970, National Canners Association, *Canned Food Pack Statistics, 1971–72*.

A case consists of 24 No. 2 cans.

P 234. Canned tomatoes produced, 1885–1970.

Source: 1885–1898, 1900–1903, and 1905–1907, see Arthur F. Burns, pp. 300–301 and 341, cited as source for series P 231. National Canners Association, 1899 and 1904, *Canned Food Pack Statistics, 1969–70;* 1908–1970, *Canned Food Pack Statistics, 1971–72*.

A case consists of 24 No. 2 cans. The figures for 1885–1907 were published in the unit case of 24 No. 3 cans. They have been converted to a unit case of 24 No. 2 cans by multiplying by 1.707. The conversion factor is taken from National Canners Association, Washington, D.C., *Canned Food Pack Statistics: 1940, part 1—Vegetables*, March 1941, p. 19.

Except for some of the early historical data which came from reports of the Bureau of the Census, the data have been compiled by the National Canners Association with the cooperation of State, regional, and commodity associations.

P 235. Beer produced, 1870–1970.

Source: 1870–1929, see Arthur F. Burns, pp. 292–293, cited as source for series P 231. U.S. Internal Revenue Service (formerly Bureau of Internal Revenue), 1930–1932, unpublished data; 1933, *Annual Report of the Commissioner of Internal Revenue, 1936;* 1934–1970, U.S. Bureau of Alcohol, Tobacco and Firearms, *Alcohol, Tobacco and Firearms, Summary Statistics*, 1973, p. 41.

The unit "barrel" contains 31 wine gallons. For 1921–1933, only cereal beverages were permitted to be produced.

P 236–236a. Distilled spirits produced, 1870–1970.

Source: 1870–1929, see Arthur F. Burns, pp. 292–293, cited as source for series P 231. U.S. Internal Revenue Service (formerly Bureau of Internal Revenue), 1930–1933, *Annual Report of the Commissioner of Internal Revenue*, annual issues. 1934–1970, see source for series P 235, p. 20.

The computation of taxable gallons excludes all fractional parts of a proof gallon less than one-tenth. Figures are for years ending June 30 and include data for Hawaii; beginning 1928, they also include data for Puerto Rico. Series P 236 includes industrial alcohol for all years. Series P 236a was derived by subtracting figures for industrial alcohol (i.e., tax-free withdrawals) from total distilled spirits production.

P 237–238. Fats and oils produced, 1922–1970.

Source: U.S. Bureau of the Census. 1922–1940, *Animal and Vegetable Fats and Oils*, annual issues; 1941–1970, Current Industrial Reports, series M20J and M20K, *Fats and Oils*, 1970 and earlier years, summary issues (prior to 1958, series M 17-1, M 17-2, and M 28).

P 239. Manufactured tobacco and snuff products, 1870–1970.

Source: 1870–1879, see source for series P 17, pp. 14–15 and 192–193; 1880–1929, see Arthur F. Burns, pp. 296–297, cited as source for series P 231; 1930–1970, U.S. Department of Agriculture, *Agricultural Statistics, 1952, 1957, 1962, 1967*, and *1971* editions.

Primary source of the figures is the *Annual Report of the Commissioner of Internal Revenue.*

P 240. Cigars, 1870–1970.

Source: 1870–1879, see source for series P 17, pp. 14–15 and 189–191; 1880–1929, see Arthur F. Burns, pp. 298–299, cited as source for series P 231. U.S. Internal Revenue Service (formerly Bureau of Internal Revenue), 1930–1939 and 1941–1949, *Annual Report of the Commissioner of Internal Revenue*, various issues; 1940 and 1950–1970, *Alcohol and Tobacco Summary Statistics*, annual issues.

For 1870–1949, figures exclude cigars weighing not more than 3 pounds per 1,000.

P 241. Cigarettes, 1870–1970.

Source: 1870–1879, see source for series P 17, pp. 14–15 and 192; 1880–1929, see Arthur F. Burns, pp. 298–299, cited as source for series P 231; 1930–1970, see source for series P 240.

Figures represent large and small cigarettes and small cigars for 1870–1949, excluding those manufactured in bonded manufacturing warehouses. For 1954–1970, small cigars are excluded.

P 242–243. Apparel products, 1927–1970.

Source: U.S. Bureau of the Census, Current Industrial Reports, series MA23A, *Annual Apparel Survey*, 1970 and earlier years, summary issues.

Men's and boys' suits and separate coats represent (1) men's suits, excluding ski, slack, snow, and uniform, (2) men's tailored dress and sport coats and jackets, excluding uniform, (3) boys' tailored dress and sport coats, and (4) boys' suits, including students', cadets', and junior boys'.

Women's, misses', and juniors' dresses include both dresses sold at a unit price and those sold at a dozen-price.

P 244. Rayon and acetate yarns available, 1911–1970.

Source: 1911–1939, Textile Economics Bureau, Inc., New York, *Textile Organon—Base Book of Textile Statistics*, vol. XXXIII, No. 1, January 1962; 1940–1955, *Textile Organon*, January–February, 1971; 1956–1970, *Textile Organon*, March 1971. (Copyright.)

Figures represent producers' domestic shipments plus imports of yarn and exclude staple, tow, waste, and other rayon and acetate products. Data for rayon relate to manmade fibers produced by the viscose, cuprammonium, and nitrocellulosic (discontinued after 1934) processes. Rayon horsehair and straw are included in the filament yarn figures for 1952–1970 (for 1940–51, production of these items averaged just under 1 million pounds per year). Acetate means manmade fibers composed of cellulose acetate and triacetate.

For 1941–1970, figures for rayon and acetate are as actually reported by the entire industry; earlier data are estimated totals based on reports obtained from 86 percent or more of the industry, with adjustments for complete coverage in accordance with information from the census of manufactures.

P 245. Non-cellulosic yarn available, 1940–1970.

Source: See source for series P 244, 1940–1970.

Data include producers' domestic shipments plus imports of yarn and exclude staple and tow.

P 246. Finished knit cloth shipped, 1933–1970.

Source: U.S. Bureau of the Census, Current Industrial Reports. 1933–1946, series M67C, *Underwear and Allied Products: Underwear, Knit Cloth, and Knit Fabric Gloves; and Underwear and Knit Cloth for Sale;* 1947–1965, series M22K, *Knit Cloth for Sale;* 1966–1970, series MQ22K, *Shipments of Knit Cloth*, summary issues.

P 247. Carpets and rugs shipped, 1899–1970.

Source: U.S. Bureau of the Census. 1899–1947, *Census of Manufactures* reports; 1954–1970, Current Industrial Reports, series M22L and MQ22K, *Carpets and Rugs*, summary issues.

P 248–250. Sodium hydroxide and ammonia produced, 1899–1970.

Source: U.S. Bureau of the Census. 1899–1939, *Census of Manufactures* reports; thereafter, Current Industrial Reports, series M28A, *Inorganic Chemicals*, summary issues.

P 251. Sulfuric acid produced, 1899–1970.

Source: U.S. Bureau of the Census. 1899–1927, unpublished data; 1929–1970, Current Industrial Reports, series M28A, *Inorganic Chemicals*, summary issues.

Figures are combined totals for sulfuric acid produced by the contact and chamber processes, including spent acid fortified in the contact plants with the simultaneous production of new acid. Production of Government-owned plants, which was large during the war period, is not included for that period; for the most part, this production was available only for military use. However, for 1954–1970, appreciable amounts of sulfuric acid produced in Government-owned privately operated plants are included. Figures for 1946–1950 include estimates based on annual totals of byproduct operations of a few smelters reporting to the Bureau of Mines; the estimated data included vary from 4 percent in 1946 to 2 percent in 1950. For 1899–1939, figures are based on reports of the Census of Manufactures; they are shown in those reports on a 50° Baume basis but are here converted to 100 percent H_2SO_4. Beginning January 1948, figures are not strictly comparable with earlier data because of the inclusion of additional plants; however, the addition of these plants increased the production of the specified chemical by less than 3.5 percent.

P 252. Paints, varnishes, and lacquers produced, 1899–1970.

Source: U.S. Bureau of the Census. 1899–1947, *Census of Manufactures*, reports for various census years; 1953–1970, Current Industrial Reports, series M28F, *Paint, Varnish, and Lacquer*, summary issues.

P 253. Superphosphates produced, 1860–1970.

Source: 1860–1954, U.S. Department of Agriculture, *Statistics on Fertilizers and Liming Materials in the United States*, Statistical Bulletin No. 191, p. 43, April 1957; 1955–1957, U.S. Bureau of the Census, *Facts for Industry*, series M19D-06 and M19D-08; 1958–1970, Current Industrial Reports, series M28B, *Inorganic Fertilizer Materials and Related Acids*, summary issues.

P 254. Light products of distillation, 1918–1970.

Source: U.S. Bureau of Mines, *Mineral Industry Surveys*, "Petroleum Statements," annual issues.

These figures relate essentially to the production of gasoline and naphtha. Figures for 1918–1927, 1929–1956, and 1962–1963 are not strictly comparable. The figure for 1929 on a basis comparable with preceding years is 438 million barrels. For 1953–1970, figures for jet fuel are excluded.

P 255. Illuminating oils (kerosene) produced, 1916–1970.

Source: U.S. Bureau of Mines, *Mineral Industry Surveys*, "Petroleum Statements," annual issues.

Figures for 1916–1927, 1929–1956, and 1962–1963 are not strictly comparable. The figure for 1929 comparable with the preceding years is 55.7 million barrels. For 1953–1959, figures exclude jet fuel. Beginning 1960, data include jet fuel used in commercial aircraft; beginning 1965, they include kerosene-type jet fuels.

P 256. Fuel oils produced, 1916–1970.

Source: See source for series P 255.

Figures for 1916–1927, 1929–1956, and 1962–1963 are not strictly comparable. The figure for 1929 comparable with the preceding years is 390 million barrels. For 1953–1970, jet fuels are excluded.

P 257. Lubricating oils produced, 1916–1970.

Source: See source for series P 255.

Figures for 1916–1927 and 1929–1956 are not strictly comparable. The figure for 1929 comparable with preceding years is 37 million barrels.

P 258. Paraffin wax produced, 1916–1970.

Source: See source for series P 255.

For 1929–1956, figures are labeled petroleum wax. The basic source of these data is the Bureau of Mines, *Minerals Yearbook*.

P 259. Pneumatic motor vehicle tires produced, 1914–1967.

Source: U.S. Bureau of the Census, *Census of Manufactures*, reports for various census years.

P 260–261. Men's and women's shoes produced, 1899–1970.

Source: 1899–1919, see Solomon Fabricant, cited as source for series P 231; U.S. Bureau of the Census, 1921–1946, *Statistical Abstract of the United States*, various editions, *1929–1947;* 1947–1954, unpublished data; 1955–1970, Current Industrial Reports, series M31A, *Shoes and Slippers*, summary issues.

Figures represent pairs of leather uppers for men's and women's shoes. They do not include youths' and boys', misses', children's,

infants', athletic, part leather, or nonleather shoes. For 1930–1970, figures for men's shoes are not strictly comparable with earlier years because large quantities of heavy footwear included with men's shoes for later years were included with athletic shoes for earlier years.

P 262. Rails produced, 1860–1970.

Source: 1860–1872, see source for series P 17; 1873–1970, American Iron and Steel Institute, *Annual Statistical Report*, various issues, 1965–1970 (copyright); and unpublished data.

Figures include both iron and steel rails, rerolled rails, and girder and high T rails. Rails are a component of "hot rolled iron and steel," series P 270. For 1860–1867, figures include production of iron rails only.

P 263. Structural iron and steel shapes produced, 1879–1970.

Source: 1879–1889, see source for series P 17; 1892–1970, American Iron and Steel Institute, *Annual Statistical Report*, various issues (copyright), and unpublished data.

Structural shapes are a component of "hot rolled iron and steel," series P 270.

P 264. Common and face brick produced, 1869–1970.

Source: 1869–1899 (decennially), 1904, 1909, 1914, 1919–1939 (biennially), 1947, 1954, 1958, 1963, and 1967, U.S. Bureau of the Census, *Census of Manufactures*, reports for various years; 1895–1912, U.S. Geological Survey, *Mineral Resources of the United States*, various issues; 1913–1959, U.S. Bureau of the Census, Facts for Industry, *Clay Construction Products*, summary issues; 1960–1970, Current Industrial Reports, series M320, *Clay Construction Products*, summary issues.

The figures for 1869 and 1879 are for common brick only. For 1889, 1899, and 1904, the production of "fancy or ornamental brick" has been added to the production of "face brick," the reason being that "the best grade of 'face' or 'front' brick appears to have been classified as 'fancy or ornamental' brick" in these years. Beginning 1943, common and face brick are classified as "unglazed" brick.

P 265–269. Raw steel produced, 1860–1970.

Source: American Iron and Steel Institute, *Annual Statistical Report*, various issues (copyright).

For 1934–1970, figures include only that part of steel castings made in foundries producing steel ingots.

P 270. Hot rolled iron and steel produced, 1864–1970.

Source: American Iron and Steel Institute, *Annual Statistical Report*, various issues, 1965–1970 (copyright), and unpublished data.

Figures include rails, plates and sheets, merchant bar and skelp production, wire rods, and structural shapes.

P 271. Copper and copper base alloy, rolled, drawn, and extruded products shipped, 1925–1970.

Source: U.S. Bureau of the Census. 1925–1947, see source for series P 259; 1952–1970, Current Industrial Reports, series BDSAF-84, *Shipments of Copper-Base Mill and Foundry Products*, summary issues.

P 272–274. Fabricated metal products, 1941–1970.

Source: U.S. Bureau of the Census, Current Industrial Reports, series M34D, *Metal Cans*, and series M34N, *Heating and Cooking Equipment (Except Electric)*, summary issues.

Warm air-furnaces, P 273, include oil- and gas-fired furnaces sold as component parts of "year-round air-conditioning units."

P 275–276. Gasoline and diesel engines produced, 1947–1970.

Source: U.S. Bureau of the Census, Current Industrial Reports, series MA35L, *Internal Combustion Engines*, summary issues.

Production data exclude engines for outboard, automotive, and aircraft purposes.

P 277. Wheel tractors, complete, produced, 1922–1970.

Source: U.S. Bureau of the Census, Current Industrial Reports, series M35S, *Tractors (Except Garden Tractors)*, summary issues.

P 278. Metal cutting machines shipped, 1947–1970.

Source: U.S. Bureau of the Census, Current Industrial Reports, series M35W, *Metalworking Machinery*, summary issues.

P 279. Typewriters shipped, 1900–1970.

Source: U.S. Bureau of the Census, Current Industrial Reports, series M35C, *Typewriters*, summary issues.

Except as indicated in footnotes, standard electric and manual and portable models are included.

P 280. Room air-conditioners shipped, 1945–1970.

Source: U.S. Bureau of the Census, Current Industrial Reports, series M35M, *Air-Conditioning and Refrigeration Equipment*, summary issues.

P 281–282. Fractional horsepower motors and integral horsepower motors and generators shipped, 1914–1970.

Source: U.S. Bureau of the Census. 1914–1958, see source for series P 259; thereafter, Current Industrial Reports, series M36H, *Motors and Generators*, summary issues.

P 283–285. Domestic ranges, electric, shipped; household refrigerators produced; and household washing machines, mechanical, shipped, 1921–1967.

Source: **Series P 284**, 1921–1937, see Solomon Fabricant, p. 585, cited as source for series P 231; all other data, see source for series P 259.

P 286–287. Electric lamps produced, 1899–1970.

Source: U.S. Bureau of the Census. 1899–1939, see source for series P 259; thereafter, Current Industrial Reports, series M36B and M36D, *Electric Lamps*.

P 288–290. Home-type radio receivers, home-type radio-phonograph combinations, and phonographs shipped, 1899–1970.

Source: U.S. Bureau of the Census. 1899–1939, see source for series P 259; thereafter, Current Industrial Reports, series MA36M, *Home-Type Radio Receivers and Television Sets, Automobile Radios, Phonographs, and Record Player Attachments*.

Home-type radio receivers and radio-phonograph combinations for 1923–1939 include automobile sets.

P 291. Trailer coaches, housing type, shipped, 1937–1967.

Source: See source for series P 259.

P 292. Truck trailers shipped, 1935–1970.

Source: U.S. Bureau of the Census. 1935–1939, see source for series P 259; thereafter, Current Industrial Reports, series M37L, *Truck Trailers*, summary issues.

P 293. Locomotives produced, 1880–1967.

Source: 1880–1929, see Arthur F. Burns, pp. 300–301, cited as source for series P 231; 1930–1945, American Railway Car Institute, *Railway Age, Annual Statistical and Outlook Number*, January 6, 1945, p. 91, and *Annual Statistical and Outlook Number*, January 5, 1946, p. 88 (copyright); 1947–1967, see source for series P 259.

For 1905–1945, Canadian output is included although the U.S. output is shown separately beginning with 1929 (see, for example, *Railway Age, Annual Statistical Number*, January 4, 1947). For 1880–1911, locomotives built in railroad repair shops are excluded. For 1942–1944, figures exclude locomotives built for U.S. Government and for lend-lease program.

This series was discontinued when the new traction power was supplied almost exclusively by diesel units. A locomotive may be composed of one or more diesel units.

Data for 1947–1967, which are from the census of manufactures, represent shipments.

P 294. Railroad passenger cars produced, 1871–1967.

Source: 1871–1914, see source for series P 17, pp. 14–15 and 196–197; 1915–1957, see source for series P 295; 1958–1967, see source for series P 259.

For 1871–1919, figures represent domestic production of passenger cars, exclusive of that in railroad repair shops; thereafter, figures include production in railroad repair shops. For 1920–1957, figures represent "passenger train cars delivered."

Data for 1958–1967, which are from the census of manufactures, represent shipments.

P 295. Railroad freight cars produced, 1871–1967.

Source: 1871–1914, see source for series P 17, pp. 14–15 and 193–196; 1915–1919, American Railway Car Institute, *Railway Age, Annual Statistical and Outlook Number*, January 7, 1939, p. 83; 1920–1957, *Railway Age, Annual Statistical and Outlook Number* (most recently entitled *Review and Outlook*), various issues, 1950–1958 (copyright); 1958–1967, see source for series P 259.

For 1871–1919, figures represent domestic production of freight cars, exclusive of that in railroad repair shops; thereafter, figures include production in railroad repair shops. For 1920–1957, figures represent "freight cars delivered."

Data for 1958–1967, which are from the census of manufactures, represent shipments.

P 296–297. Horse-drawn vehicles produced, 1899–1967.

Source: 1899–1937, see Solomon Fabricant, p. 585, cited as source for series P 231; 1939–1967, see source for series P 259.

For 1899–1914, figures for farm wagons, trucks, and business vehicles include patrol wagons, ambulances, handcarts, and push-carts; for 1919–1925, they exclude mail carrier wagons and public conveyances and relate to products made within the industry (as classified by the Bureau of the Census); for 1927–1967, figures relate to all products made regardless of the industry classification of the establishment.

For 1899–1925, figures for carriages, buggies, and sulkies exclude sulkies; for 1933, include two-wheeled carts.

P 298. Bicycles produced, 1899–1967.

Source: 1899–1937, see Solomon Fabricant, p. 590, cited as source for series P 231; 1939–1967, see source for series P 259.

For 1899–1921, figures relate to products made within the industry (as classified by the Bureau of the Census); for 1923–1967, figures relate to all products made regardless of the industry classification of the establishment.

P 299–300. Pianos and organs produced, 1899–1967.

Source: 1899–1937, see Solomon Fabricant, pp. 597 and 598, cited as source for series P 231; 1939–1967, see source for series P 259.

For organs, series P 300, the data represent reed organs for 1899–1935, electronic organs thereafter.

P 301–317. General note.

Capacity is rarely calculated on the basis of full-time operation of an industry (i.e., 365 days a year, 24 hours a day), but at varying criteria short of that. Capacity as of January 1 is generally used as the basis of computation. Exceptions to these general rules are noted in the text for each series, where applicable.

P 301. Blast furnaces (pig iron), 1898–1960.

Source: American Iron and Steel Institute, *Annual Directory* and *Annual Statistical Report*, New York, various issues (copyright).

Figures include a 6.1 percent deduction from full-time operation to allow for rebuilding, relining, and repairing the equipment. Capacity is based on April 1 for 1898; November 1, 1901 and 1907; June 1, 1904; and the average of January 1 and July 1 for 1941–1944 and 1950.

None or negligible capacity in Alaska and Hawaii.

P 302. Steel ingots and steel for castings, 1887–1960.

Source: See source for series P 301.

Figures include a 9.1 percent deduction from full-time operation to allow for rebuilding, relining, and repairing equipment, and for holiday shutdowns. Capacity is based on an average of January 1 and July 1 for 1941–1944.

None or negligible capacity in Alaska and Hawaii.

P 303. Copper refining, 1907–1970.

Source: 1907–1930, Edwin G. Nourse, *America's Capacity to Produce*, The Brookings Institution, Washington, D.C., 1934, p. 557; 1931–1970, American Bureau of Metal Statistics, *Year Book*, New York, various issues. (Copyright.)

None or negligible capacity in Alaska and Hawaii.

P 304–305. Lead refining, 1921–1970.

Source: American Bureau of Metal Statistics, *Year Book*, New York, various issues (copyright).

None or negligible capacity in Alaska and Hawaii.

P 306. Zinc refining, 1921–1970.

Source: See source for series P 304–305.

Figures are not comparable throughout because of changes in components. For 1921–1925, figures represent distillation zinc; 1926–1940, distillation and electrolytic zinc; 1941–1970, slab zinc. As an alternative source for data, see U.S. Bureau of Mines, *Minerals Yearbook*, various issues.

None or negligible capacity in Alaska and Hawaii.

P 307. Aluminum ingots, 1889–1970.

Source: 1889–1895, J. D. Edwards, et al., *The Aluminum Industry*, McGraw-Hill Publishing Co., New York, 1930 (copyright); 1910–1919, U.S. Business and Defense Services Administration (now Bureau of Domestic Commerce), *Materials Survey, Aluminum*, 1956; 1927–1938, U.S. Surplus Property Board, *Aluminum Plants and Facilities Report*, 1945; 1939–1970, American Bureau of Metal Statistics, *Year Book*, New York, various issues (copyright).

The general practice in this industry is to rate potline capacity

on full-time operation. As an alternative source for data, see U.S. Bureau of Mines, *Minerals Yearbook*, various issues.

None or negligible capacity in Alaska and Hawaii.

P 308. Portland cement, 1910–1970.

Source: U.S. Geological Survey, 1910–1923, *Mineral Resources of the United States*, annual volumes; U.S. Bureau of Mines, 1924–1931, *Mineral Resources of the United States*, annual volumes; 1932–1970, *Minerals Yearbook*, annual volumes.

A deduction from full-time operation is taken for estimated average number of days required for repair or other unavoidable shutdowns. Favorable labor, fuel, and transportation conditions are assumed.

No capacity in Alaska; figures include Hawaii beginning 1960.

P 309. Crude petroleum refining, 1918–1970.

Source: U.S. Bureau of Mines, 1918–1961, *Petroleum Refineries, Including Cracking Plants in the United States, January 1, 1961* (also shown in *Minerals Yearbook*); 1962–1970, *Mineral Industry Survey*, Petroleum Refineries in the United States and Puerto Rico, January 1, annual issues.

Capacity is defined as the maximum daily average throughput (converted to an annual basis) of the plant in complete operation, with allowance for necessary shutdown time for routine maintenance, repairs, etc. It approximates the maximum daily average crude runs to stills that can be maintained for an extended period. Capacity is based on November 1 for 1924.

Includes Alaska for all years, Hawaii beginning 1960.

P 310–311. Coke, 1909–1961.

Source: 1909–1920, see first source cited for series P 303; 1921–1961, see sources cited for series P 308.

None or negligible capacity in Alaska and Hawaii.

P 312. Carbon black, 1928–1970.

Source: See source for series P 308.

None or negligible capacity in Alaska and Hawaii.

P 313. Sulfuric acid, 1945–1970.

Source: 1945, reprinted with permission from *Chemical and Engineering News*, Washington, D.C., July 10, 1945 (copyright by American Chemical Society); 1950–1970, U.S. Bureau of Domestic Commerce (formerly Business and Defense Services Administration), *Chemical Industry Report*, various issues.

Capacity is based on 350 days a year.

None or negligible capacity in Alaska and Hawaii.

P 314. Phosphatic fertilizers, 1900–1970.

Source: 1900–1951, U.S. Agricultural Research Service, *Statistics on Fertilizers and Liming Materials in the United States*, Statistical Bulletin No. 191, April 1957; 1952–1957, National Plant Food Institute, *Plant Food Review*, vol. 4, Nos. 2 and 3, 1958; 1958–1970, U.S. Bureau of Domestic Commerce (formerly Business and Defense Services Administration), unpublished data.

These data are the total of normal superphosphate, concentrated superphosphate, and miscellaneous phosphatic materials. Capacity of normal superphosphate is based on 300 two-shift days a year. Capacity of concentrated superphosphate and other phosphatic materials is based on 350 days a year, continuous operations.

None or negligible capacity in Alaska and Hawaii.

P 315. Total combined nitrogen, 1924–1970.

Source: 1924–1950, see source for series P 314; 1951–1955, U.S. Business and Defense Services Administration, *Summary Information on Anhydrous Ammonia*, Bulletin No. 142, February 1956; 1956–1970, U.S. Bureau of Domestic Commerce (formerly Business and Defense Services Administration), unpublished data.

This series was entitled "synthetic nitrogen" from 1924–1955. Capacity is based on 350 days a year, continuous operations.

None or negligible capacity in Alaska and Hawaii.

P 316. Rayon and acetate yarn, staple and tow, 1911–1970.

Source: 1911, *New York Times*, Special Chemistry Section, September 2, 1951; 1931–1970, Textile Economics Bureau, *Textile Organon* (prior to 1952, *Rayon Organon*), New York, various issues. (Copyright.)

Data for 1931–1938 are for yarn only; staple and tow data are not available for those years.

Capacity is as of November for all years except 1933 (July) and 1944 (April). Allowance was made for periodic shutdowns of machines for repair, overhaul, or cleaning on a set time schedule.

None or negligible capacity in Alaska and Hawaii.

P 317. Paper and paperboard, 1900–1970.

Source: American Paper Institute, *The Statistics of Paper, 1957*, and subsequent annual issues, New York (copyright).

Historic capacity, used until 1955, is based on 310 days a year, 24 hours a day, for paper and building paper and 313 days for paperboard. From 1956 to 1969, practical maximum capacity was used, based on 340 days a year for paper, 339 days for paperboard, and 326 days for construction paper and board and wet machine board. In 1970, practical maximum capacity was based on 346 days for all grades, 348 days for paper, 346 days for paperboard, and 334 days for construction paper and board and wet machine board.

Includes Alaska and Hawaii beginning 1960.

P 318–374. Value of output of finished commodities and construction materials destined for domestic consumption at current producers' prices, and implicit price indexes for major commodity groups (Shaw), 1869–1939.

Source: William H. Shaw, *Value of Commodity Output Since 1869*, National Bureau of Economic Research, New York, 1947, pp. 30, 66, and 290 (copyright).

These estimates are derived from census of manufactures data, supplemented by less complete data for nonmanufactured finished commodities and construction materials and for intercensal year interpolations. The estimates before 1919 are based necessarily on less adequate information.

The estimates of finished commodities measure the value of commodities that have reached the form in which they are used by ultimate recipients—largely households in the case of consumers' goods, chiefly business and public enterprises in the case of producers' goods. The amount "destined for domestic consumption" is derived as the sum of domestic production, minus exports, plus imports. In most years and for most commodities, the differences between domestic production of finished commodities and finished commodities destined for domestic consumption were modest. Changes in the latter, therefore, can be used as an approximate measure of changes in domestic manufacturing output. For figures on domestic output of finished commodities at producers' prices for 1919–1933, see Simon Kuznets, *Commodity Flow and Capital Formation*, vol. 1, National Bureau of Economic Research, New York, 1938, pp. 136–138 and 348.

The estimates presented here exclude transportation and distribution costs incurred after the production stage, and hence are not in terms of prices to final users. Nor do they measure domestic consumption for they make no allowance for inventory changes.

Perishable commodities include those usually lasting less than 6 months; semidurable, those usually lasting from 6 months to 3 years; and durable, those usually lasting more than 3 years. For a detailed discussion of sources and procedures, see the source, part II for estimates of the value of output, part III for exports and imports, and part IV for price indexes.

Series P 1–12. Manufactures Summary: 1849 to 1970

Year	Establishments		Persons engaged in manufacturing (1,000)			Man-hours, production workers (mil.)	Payroll (mil. dol.)			Value added by manufacture [2] (mil. dol.)	Capital expenditures, new (mil. dol.)	End-of-year inventories (mil. dol.)
	Total	With 20 or more employees	Proprietors and partners	Non-production employees	Production workers [1]		Total	Salaries	Wages			
	1	2	3	4	5	6	7	8	9	10	11	12

[1] The Bureau of Labor Statistics annual averages for employment in manufacturing indicates 1943 as the year of maximum employment, with 15,147,000 production workers. See series D 145.

[2] For 1849–1933, cost of contract work was not subtracted from value of products in calculating value added by manufacture. For 1935–1953, value added by manufacture represents unadjusted value added; beginning 1954, it represents adjusted value.

[3] Except as noted, figures have been revised by retabulation of returns to exclude data for establishments classified as manufacturing in 1939 but as nonmanufacturing beginning 1947. Value added by manufacture in 1939, prior to revision and on a basis comparable with prior years, was $24.7 billion.

[4] Includes establishments classified as manufacturing in 1939 and prior years but as nonmanufacturing thereafter.

[5] Figures revised on basis of estimates rather than by retabulation of 1939 reports. Estimates made as follows: For nonproduction employees, by multiplying the retabulated figure for number of production workers by the ratio of all employees to production workers computed from unrevised 1939 data; for salaries and wages, by multiplying the retabulated wage figure by the ratio for salaries and wages also derived from the unrevised 1939 data.

[6] Excludes data for salaried officers of corporations and their salaries; therefore, not strictly comparable with figures for other years.

[1] Beginning 1947, for food and kindred products, excludes driver-salesmen in bakery products industry. Number of driver-salesmen for 1939 was at least 120,000.

[2] Beginning 1954, includes milk bottling plants. Value added for this industry in 1954 was $1,476 million.

[3] Beginning 1933, excludes establishments primarily engaged in manufacture of ethyl alcohol.

[4] Beginning 1927, includes establishments primarily engaged in manufacture of vegetable cooking oils.

[1] Beginning 1958, excludes establishments primarily producing hats, except cloth and millinery, and those primarily producing hard-surface floor covering except asbestos, plastic, or rubber; therefore, data are not entirely comparable with those for earlier years. The 1957 employment was 12,428 for the hats except millinery industries and 8,736 for the hard-surface floor covering industry. Also, prior to 1958, excludes establishments primarily engaged in shrinking and sponging of cloth; such establishments had 1,728 employees in 1958.

[2] For 1937 and 1939, includes establishments that cut and stitch products from knit cloth made in separate mills of integrated companies.

[1] Prior to 1958, excludes establishments producing hats, except cloth and millinery. In 1954, these establishments had 12,988 employees and $61,886 thousand value added by manufacture. Also prior to 1958, includes establishments primarily engaged in shrinking and sponging of cloth. In 1958, such establishments had 1,723 employees and $10,709 thousand value added by manufacture.

[2] For 1937 and 1939, excludes establishments that cut and stitch products from knit cloth made in separate mills of integrated companies.

[3] Horsepower of prime movers only.

[4] Prior to 1958, excludes establishments primarily engaged in manufacture of hard pressed wood fiberboard and those primarily engaged in manufacturing fabricated hardboard products.

[5] In 1949 and 1950, there was a significant undercoverage in the sample for this major group, especially in the logging camps and logging contractors industry.

[6] For 1937–1947, excludes logging contractors and independent logging camps not operating sawmills as well as establishments primarily engaged in manufacture of venetian blinds.

[1] For 1937–1947, excludes logging contractors and independent logging camps not operating sawmills as well as establishments primarily engaged in manufacture of venetian blinds.

[2] For 1899–1929, excludes establishments primarily engaged in manufacture of wood and vehicle stock. For 1931, value added by manufacture on a basis comparable with 1929 is $523.8 million; 1931, on new basis, $524.4 million.

[3] For 1899–1923, includes establishments engaged in manufacture of rules made of metal and other materials as well as wood; figures for later years include establishments making wooden rules only.

[4] Beginning 1914, excludes establishments primarily engaged in manufacture of windows and door screens. For 1914, excludes establishments engaged in manufacture of laths and shingles; value added by manufacture on a basis comparable with prior years was $652 million.

[5] Beginning 1939, includes establishments primarily engaged in manufacture of metal partitions. For 1939, value added by manufacture on a basis comparable with prior years was $411 million.

[6] Beginning 1937, includes establishments primarily engaged in manufacture of venetian blinds. For 1937, value added by manufacture on a basis comparable with prior years was $418 million.

[7] For 1899–1925, excludes establishments primarily engaged in manufacture of sewing machine cases, cabinets, and tables.

[8] For 1899–1909, excludes establishments primarily engaged in manufacture of window and door screens. For 1914, value added by manufacture on a basis comparable with prior years was $169 million.

[1] Beginning 1958, excludes hard pressed wood fiberboard mills.

[2] Beginning 1947, includes establishments primarily engaged in the manufacture of tags.

[3] Beginning 1939, includes establishments primarily engaged in the manufacture of printed paper patterns and laminated enamel hard pressed insulating wallboards of vegetable fiber. In 1939, value added by manufacture on a basis comparable with prior years was $870 million.

[4] Beginning 1937, includes establishments primarily engaged in the manufacture of fiber products, fiber conduits, and molded pulp products. In 1937, value added by manufacture on a basis comparable with prior years was $853 million.

[5] Beginning 1931, includes establishments primarily engaged in manufacture of papeteries. In 1931, value added by manufacture on a basis comparable with prior years was $600 million.

[6] Prior to 1947, includes establishments primarily engaged in the manufacture of tags.

[1] Printing and publishing—for 1909–1933, cost of contract work was subtracted from value of products in calculating value added by manufacture only for the industries in which it was significant. For 1899 and 1904, cost of contract work was not subtracted from value of products for any industries. In 1909, value added by manufacture on a basis comparable with prior years was $556 million.

[2] Prior to 1939, includes establishments primarily engaged in the manufacture of paper patterns.

[3] For 1933, excludes establishments engaged solely in music publishing.

[4] Beginning 1949, includes Government-owned plants operated by private firms for the account of the Federal Government.

[5] Beginning 1939, excludes establishments primarily engaged in manufacture of electrometallurgical products. In 1939, value added by manufacture on a basis comparable with prior years was $1,838 million.

[6] Beginning 1937, excludes establishments primarily engaged in mining of rock salt or in smelting and refining of aluminium; in 1937, value added by manufacture on a basis comparable with prior years was $1,759 million. Also beginning 1937, excludes woods employees of the gum naval stores industry; in 1937, production workers numbered 30,880 with wages of $8.6 million.

[7] Beginning 1933, includes establishments primarily engaged in manufacture of ethyl alcohol.

[8] Beginning 1929, excludes establishments other than petroleum refineries engaged in manufacture of lubricating oils.

[9] Beginning 1927, excludes establishments primarily engaged in manufacture of vegetable cooking oils.

[10] Beginning 1925, excludes certain establishments primarily engaged in manufacture of rubber cement. In 1925, value added by manufacture on a basis comparable with prior years was $1,321 million.

[11] For 1899, includes establishments primarily engaged in manufacture of candles. In 1904, value added by manufacture on a basis comparable with 1899 was $287 million.

[1] Beginning 1954, excludes beehive and byproduct coke ovens.

[2] For 1947, excludes byproduct coke plants operated in conjunction with public utilities manufacturing and distributing gas, and includes establishments primarily engaged in shipping lubricants and greases made from animal and vegetable oils.

[3] Prior to 1939, excludes byproduct coke ovens owned by city gas companies. In 1939, such ovens represented less than 2 percent of the total value of products for this commodity group.

[4] For 1935, excludes a few establishments primarily engaged in blending and compounding lubricating oils.

[5] Beginning 1929, excludes lubricants not elsewhere classified and paving mixtures and blocks. In 1929, these industries represented 4 percent of the production workers and 5 percent of the value added by manufacture for this commodity group.

[6] For 1899 and 1904, excludes fuel briquets and roofing felts and coatings. In 1909 these industries represented 6 percent of the production workers and 9 percent of the value added by manufacture for this commodity group.

[7] Beginning 1958, includes establishments engaged in molding plastics products for the trade and fabricating miscellaneous finished plastics products.

[1] For 1939, 1947, and 1954, excludes establishments primarily engaged in producing ready-mixed concrete. In 1958, the value added in such establishments represented 12 percent of the total value added for this commodity group and, in 1937, less than 1 percent. The value added at quarries operated in conjunction with manufacturing establishments (including value added in producing mineral products consumed in the same establishment) was $194 million in 1954, $361 million in 1958, and $321 million in 1963.

[2] Beginning 1954, includes beehive and byproduct coke ovens.

[3] For 1937, includes establishments primarily engaged in producing certain nonferrous bearings and aluminum products (ship bunks, ornamental metal work, stampings, novelties, valves and fittings, machined castings and tags) and excludes establishments primarily engaged in making electrometallurgical products, nonferrous die castings and forgings, cast aluminum cooking ware, and in the heat treatment of steel. In 1939, value added by manufacture on a basis comparable with 1937 was $2,131 million.

[1] For 1937, excludes establishments primarily engaged in producing lawn sprinklers, spun ware, nonferrous metal novelties, tackle blocks, aluminum ornamental work, aluminum stampings, and machine knives (except metalworking) and includes establishments primarily engaged in making caulking guns, toilet seats, brooders, cast aluminum cooking ware, and hair clippers. In 1939, value added by manufacture on a basis comparable with 1937 was $1,340 million.

[2] Includes electrical machinery.

[3] For 1937, includes establishments primarily engaged in manufacture of thermostats and gauges, heat treating of steel, machine knives, and tackle blocks, and excludes establishments primarily engaged in manufacture of vacuum cleaners, turbo-generators and water-wheel generator sets, hair clippers for animal use, brooders, nonferrous bearings, certain industrial furnaces and ovens, time-stamps and time-recording machines, dictating machines, certain valves and fittings (except plumbers'), and caulking guns. In 1939, value added by manufacture on a basis comparable with 1937 was $1,990 million.

[1] Beginning 1958, includes establishments primarily engaged in manufacture of household refrigerators and home and farm freezers; household laundry equipment and sewing machines; water heaters, except electric; and other household appliances. Excludes those primarily engaged in manufacture of hearing aids; high frequency, induction, and dielectric heating apparatus; commercial food warming equipment; industrial electric heating units and devices; and insulated wire and cable made from purchased wire. [2] Included with machinery, except electrical.

[3] Beginning 1947, includes establishments primarily engaged in manufacture of electric (dry) shavers.

[4] Beginning 1939, excludes establishments primarily engaged in manufacture of vacuum cleaners, turbo-generators and water-wheel generator sets, dictating machines and electric industrial furnaces and ovens. In 1939, value added by manufacture on a basis comparable with prior years was $1,000 million.

[5] Beginning 1935, excludes establishments primarily engaged in manufacture of certain types of beauty and barber shop equipment.

[6] Beginning 1927, excludes establishments primarily engaged in manufacture of certain types of mechanical refrigerators.

[7] Beginning 1909, excludes establishments primarily engaged in manufacture of signs and advertising novelties.

[8] Beginning 1958, includes establishments primarily engaged in manufacture of truck and bus bearings, convertible tops for automobiles, rebuilt automotive parts, and aircraft and related engine and power take-off gears and excludes those primarily engaged in manufacture of parachutes.

[9] For 1937, includes railroad repair shops. In 1939, value added by manufacture on a basis comparable with 1937 was $1,794 million.

Series P 58–67. General Statistics for Manufacturing Industries, by Major Groups: 1899 to 1970—Con.

[1] Beginning 1958, includes establishments primarily engaged in manufacture of laboratory precision balances, laboratory furniture, revolution counters, operating room and other hospital furniture, surgical corsets, and hearing aids and excludes those primarily engaged in manufacture of sanitary napkins and tampons.

[2] For 1947 and 1954–1970, includes establishments primarily engaged in manufacture of automatic temperature controls.

[3] Beginning 1939, includes establishments primarily engaged in manufacture of thermostats and gauges and excludes those primarily engaged in manufacture of time-recording stamps and machines. In 1939, value added on a basis comparable with prior years was $314 million.

[4] Beginning 1937, includes establishments primarily engaged in manufacture of certain mechanical measuring instruments. In 1937, value added by manufacture on a basis comparable with prior years was $295 million.

[5] Beginning 1935, includes establishments primarily engaged in manufacture of certain dental equipment and supplies (chairs, cabinets, and electrical devices).

[6] Beginning 1929, excludes establishments primarily engaged in manufacture of gas machines. In 1929, value added by manufacture on a basis comparable with prior years was $306 million.

[7] Beginning 1927, excludes dental laboratories operating on a custom basis. In 1927, value added by manufacture on a basis comparable with prior years was $280 million.

[8] Beginning 1925, excludes establishments primarily engaged in grinding lenses for spectacles and eyeglasses to individual prescription.

[9] Beginning 1914, includes establishments primarily engaged in manufacture of motion-picture machines. In 1914, value added by manufacture on a basis comparable with prior years was $96 million.

[10] Includes ordnance.

[11] Beginning 1958, excludes establishments primarily engaged in manufacture of plastics products not elsewhere classified, cork products, soda-fountain and bar equipment, and jewelry, instrument, and musical instrument cases and includes those primarily engaged in manufacture of linoleum and other hard surface floor covering, n.e.c.

[12] Prior to 1955, includes ordnance and accessories.

Series P 68–73. Horsepower of Power Equipment in Manufacturing Industries: 1869 to 1962

NA Not available.

[1] Covers factories having annual production of $5,000 or more.

[2] Some minor groups are not adjusted for investment in emergency facilities after "normal" depreciation or intangible assets. Therefore, sum of detail does not equal totals.

[3] Includes firms engaged in shipbuilding which were excluded in other years.

[4] Covers factories having annual production of $500 or more.

[5] Includes custom and neighborhood shops.

[6] N.e.c. means not elsewhere classified.

Series P 197–204. Concentration in Manufacturing, by Industry Group: 1901, 1947, and 1954

[Concentration ratio is defined as the percent of total "4-digit" SIC industry sales (or value added) made by 4 largest sellers. See text]

SIC code No.	Industry group (1947 and 1954 census classification)	Value added by 4-digit industries with concentration ratio over 50 as percent of value added by all industries in a 2-digit industry group		Average concentration ratios					
				1947 value-added weights	1954 value-added weights	1947 employment weights		1954 employment weights	
		1901 [1]	1947 [2]	1947	1954 [3]	1947	1954	1947	1954
		197	198	199	200	201	202	203	204

29	Petroleum and coal products	46.8	13.6	39.5	36.6	39.5	37.0	39.4	36.7
30	Rubber products	100.0	59.9	58.6	54.1	57.0	56.0	52.1	51.0
31	Leather and leather products	26.3	–	26.2	26.4	26.1	26.6	25.9	26.6
32	Stone, clay, and glass products	13.3	43.9	43.4	46.4	30.6	78.8	79.0	77.7
33	Primary metal products	[4] 45.7	21.0	43.8	49.5	40.6	45.3	41.4	46.7
34	Fabricated metal products		8.4	25.3	26.1	26.7	26.0	26.6	25.4
35	Machinery, except electrical	[5] 41.4	18.5	38.0	33.2	38.2	38.9	37.6	37.8
36	Electrical machinery		58.2	54.1	48.2	53.4	50.5	50.8	47.9
37	Transportation equipment	57.3	84.2	54.4	58.7	54.0	63.3	53.7	56.6
38	Instruments and related products		45.0	45.3	47.4	52.8	52.5	54.0	53.5
39	Miscellaneous manufactures	2.7	21.2	34.9	16.1	31.5	30.1	29.0	28.6

– Represents zero.
[1] 319 (4-digit) industries. Various years 1895–1904; central date was approximately 1901 but weighting factors used were as of 1899.
[2] 452 (4-digit) industries.
[3] 434 (4-digit) industries.
[4] Excludes steel works and rolling mills for which the concentration ratio is 78.8.
[5] Includes electrical machinery.

Series P 231–300. Physical Output of Selected Manufactured Commodities: 1860 to 1970—Con.

Year	Pneumatic motor vehicle tires produced	Shoes produced (except athletic)		Construction materials			Primary and fabricated metals						
							Raw steel produced					Hot rolled iron and steel produced[17]	Copper and copper base alloy, rolled, drawn, and extruded products shipped[11]
		Men's	Women's	Rails produced[17]	Structural iron and steel shapes produced[17]	Common and face brick produced	Total[18]	Bessemer[17]	Open hearth[17]	Crucible[17]	Electric and all other[17]

* Denotes first year for which figures include Alaska and Hawaii.
– Represents zero. NA Not available. Z Less than 500 short tons.
[1] Figures for 1915–1929 are for crop years ending June; all others are for calendar years. The 1914 crop year figure is 114.2 million barrels. The 1929 calendar year figure is 120.0 million barrels.
[2] Figures are for years ending June 30.
[3] Prior to 1959, shortening only; figures for salad and cooking oils not collected.
[4] Includes large and small sizes.
[5] Data for 53 weeks.
[6] Includes boys' uniform clothing.
[7] Excludes separate coats.
[8] Includes children's and infants'.
[9] Alcoholic content limited to 3.2 percent by weight from Apr. 7–Dec. 5, 1933.
[10] Includes 1,589 thousand barrels produced prior to Apr. 7 (effective date of the Act of Mar. 22, 1933).
[11] From beginning of series through 1939, represents amount produced.
[12] Beginning 1964, includes kerosene type jet fuel.
[13] Tufted only.
[14] Represents only reported quantities produced; not adjusted to include estimated production for establishments not reporting.
[15] For 1939–1949, excludes flakes and powders; for 1939–1942, also excludes solids.
[16] Amount for sale.
[17] Beginning 1959, includes Hawaii.
[18] Beginning 1953, includes production by basic oxygen process, not shown separately here.
[19] Represents shipments of heavy steel structural shapes; comparable figure for 1968 is 5,557 thousand.
[20] Represents shipments of steel products; comparable figure for 1968 is 91,856 thousand.
[21] Bessemer included with open hearth.
[22] Includes bicycle tires.
[23] Excludes motorcycle tires.
[24] Excludes amount produced and consumed in same works.
[25] Prior to 1961, represents thousands of short tons of metal consumed in manufacture of cans. Comparable figure for 1961 is 5,039 thousand.
[26] For October–December, excludes standard portable typewriters and specialized typewriters (i.e., specialized composing typewriters, coded media typewriters, and input/output typewriters).
[27] Represents tinplate cans shipped.
[28] Excludes other than free-standing ranges.
[29] Excludes specialized typewriters.
[30] Listed as self-contained window sill type.
[31] Amount produced.
[32] Represents orders booked rather than shipments; comparable figure for 1944 is 226 thousand.
[33] 2½ kw. and over.
[34] Represents sales.
[35] Includes disk stoves and hotplates.
[36] Includes rebuilt locomotives.
[37] Represents shipments. For bicycles, 1963 and 1967, excludes children's 2-wheel sidewalk cycles with semipneumatic tires.
[38] Civilian only.
[39] For phonographs, amount produced, 1921–1929. Radio-phonograph combinations included with phonographs, 1919–1925.
[40] Not strictly comparable with later years because of changes in classification.
[41] Represents electronic organs shipped.

Series P 301–317. Total Production Capacity of Selected Manufacturing Industries: 1887 to 1970

[**In thousands of short tons unless otherwise stated.** Capacity is usually rated as of January 1. See text for exception]

Year	Blast furnaces (pig iron)	Steel ingots and steel for castings [1]	Copper refining [2]	Lead refining		Zinc refining [3]	Aluminum ingots	Portland cement	Crude petroleum refining (mil. 42-gal. bbl.) Series P 301–317. Total Production Capacity of Selected Manufacturing Industries: 1887 to 1970—Con.

[In thousands of short tons unless otherwise stated]

Year	Blast furnaces (pig iron)	Steel ingots and steel for castings [1]	Copper refining [2]	Lead refining		Zinc refining [3]	Aluminum ingots	Portland cement	Crude petroleum refining (mil. 42-gal. bbl.)	Coke		Carbon black	Sulfuric acid	Phosphatic fertilizers [4]	Total combined nitrogen	Rayon and acetate yarn, staple and tow	Paper and paperboard
				Silver-lead refineries	Smelters and refiners of Missouri lead					By-product (slot type)	Beehive						
	301	302	303	304	305	306	307	308	309	310	311	312	313	314	315	316	317

* Denotes first year for which figures include Alaska and Hawaii.
NA Not available. Z Less than 500 tons.
[1] From open hearth, Bessemer, crucible, and electric furnaces.
[2] 1944–1970 includes electrolytic refining capacity plus Lake Superior and fire-refined; 1907–1943, electrolytic capacity only.
[3] 1941–1970, slab zinc; 1926–1940, distillation and electrolytic zinc; 1921–1925, distillation zinc.
[4] Available phosphoric oxide (P_2O_5).
[5] Beginning 1960, includes Hawaii.
[6] Beginning 1960, includes Hawaii; includes Alaska for all years.

Series P 318–374. Value of Output of Finished Commodities and Construction Materials Destined for Domestic Consumption at Current Producers' Prices, and Implicit Price Indexes for Major Commodity Groups (Shaw): 1869 to 1939

[In millions of dollars]

Year	Total, all finished commodities	Perishable								Semidurable				
		Total	Food and kindred products		Cigars, cigarettes, and tobacco	Drug, toilet, and household preparations	Magazines, newspapers, misc. paper supplies, etc.	Fuel and lighting products		Total	Dry goods and notions	Clothing and personal furnishings	Shoes and other footwear	House-furnishings

[1] Does not agree with source, which is in error.
[2] Shaw's estimates for 1869–1919; Kuznets' estimates adjusted by Shaw for 1919–1939. See source, p. 104, for explanation.
[3] Agrees with source; however, figures for components do not add to total shown.
[4] Indexes derived by weighting the individual group indexes by the average current price estimates for 1933, 1935, and 1937. The composite indexes thus calculated were used to interpolate and extrapolate the implicit indexes for 1933, 1935, and 1937.
[5] Based on the movement of the NBER price index for processed capital equipment goods.

Chapter Q

Transportation

Highway Transportation (Series Q 1-263)

Q 1–263. General note.

In 1894, the Federal Government created an Office of Road Inquiry to initiate experiments and conduct inquiries concerning the best methods of road building. It was succeeded by the Office of Public Roads and Rural Engineering in 1916 and by the Bureau of Public Roads in 1918 (the latter was called the Public Roads Administration during 1939–1949). The bureau was transferred to the Department of Transportation in 1966 and its functions assigned to the Federal Highway Administration. Surveys of highway mileage, revenues, and expenditures were made in 1904, 1909, and 1914.

In 1916, Congress passed the first of the many Federal-aid highway acts, under which the Federal Government has contributed to the cost of constructing highways designated as parts of the Federal-aid system. The Federal Highway Administration administers Federal legislation providing for the improvement, in cooperation with the States, of roads on the Federal-aid primary, secondary, and interstate highway systems. As the principal road-building agency of the Federal Government, it also cooperates with the Forest Service, the National Park Service, and other Federal agencies in the construction of roads in national forests, parks, and other areas.

The principal sources (1973) of data on public roads and on ownership and operation of motor vehicles is the Federal Highway Administration's annual *Highway Statistics* and its *Highway Statistics, Summary to 1965.* Another major source of data is the Interstate Commerce Commission. Among its publications are the monthly *Transport Economics* and the *Annual Report,* containing data on all types of domestic transport and the annual *Transport Statistics in the United States.*

Various censuses conducted by the U.S. Bureau of the Census also provide data relating to transportation. Reports of the census of manufactures and the census of business and the *Annual Survey of Manufactures* present statistics on the motor vehicle and equipment industry and on retail, wholesale, and services aspects of this industry.

Q 1–11. Volume of domestic intercity passenger traffic, by type of transport, 1950–1970.

Source: U.S. Interstate Commerce Commission, *Annual Report* and *Transport Economics,* various issues.

Q 12–22. Volume of domestic intercity freight traffic, by type of transport, 1939–1970.

Source: U.S. Interstate Commerce Commission, 1939–1959, *Intercity Ton-Miles, 1939–1959,* Statement No. 6103; 1960–1970, *Annual Report* and *Transport Economics,* various issues.

This study is intended to show, on as nearly comparable a base as possible, the intercity ton-miles by the various means of transport. Information sufficient in quantity and accuracy is not available to cover all modes of transport on a comparable basis before 1939. Estimates of intercity ton-miles for a period from sometime before 1939 through part of World War II are contained in the Bureau of Transport Economics and Statistics release, *Postwar Traffic Levels,* Statement No. 4440, issued in 1944. These estimates, however, are not on bases comparable with those in the 1939–1959 series.

A ton, as used here, is 2,000 pounds; and a mile is 5,280 feet. A ton-mile is a ton of freight carried one mile. These definitions apply to all means of transport covered. To this extent, all figures presented here are comparable. Further, as far as possible, local switching, local delivery, lighterage, and rural to rural movements have been eliminated to confine operations to intercity only.

Q 23–35. Operating revenues, by type of transport, 1936–1970.

Source: Except for series Q 28, U.S. Interstate Commerce Commission, 1936–1956, *Statistics of Class I, II, and III Motor Carriers, 1939–1956,* Statement No. 589; 1957–1970, *Annual Report* and *Transport Economics,* various issues, and unpublished data. **Series Q 28,** U.S. Federal Aviation Administration, *FAA Statistical Handbook of Aviation,* various editions.

Q 36–46. Employment in selected types of transportation, 1947–1970.

Source: U.S. Bureau of Labor Statistics, *Employment and Earnings, United States, 1909–72,* Bulletin 1312–9, pp. 526–532.

Q 36, total. Represents about 80 percent of all employment in transportation. Data for types of transportation other than those shown here are available in the source only for shorter and current periods.

Q 47–49. Indexes of transportation output, 1889–1966.

Source: 1889–1946, National Bureau of Economic Research, New York, Harold Barger, *The Transportation Industries, 1889 to 1946* (copyright); 1947–1966, estimates by John W. Kendrick, George Washington University.

Sources of figures and methods of computation are described in Barger's book. The components of passenger traffic, series Q 48, are airlines, intercity buslines, waterways, and steam railroads. For freight traffic, series Q 49, the components are motor trucking, pipelines, waterways, and steam railroads.

Q 50–55. Mileage of rural roads and municipal streets, 1904–1970.

Source: U.S. Bureau of Public Roads, 1904–1920, *Highway Statistics, Summary to 1955.* U.S. Federal Highway Administration, 1921–1965, *Highway Statistics, Summary to 1965;* 1966–1970, *Highway Statistics,* annual issues.

Rural roads are defined roughly as those roads located outside of incorporated communities or delimited places generally having more than 1,000 inhabitants. Estimates for earlier years for total mileage of rural roads are (in thousands of miles): 1904, 2,151; 1909, 2,200; 1914, 2,446.

Municipal and other mileage figures for 1934 and 1935 represent only mileage on municipal extensions of State systems, which are State administered. Mileage not on State or county systems was initially included in 1936 (67,000 miles). Mileage on local city streets was first included in 1941 (274,000 miles for that year). Municipal extensions are continuations of State System roads through communities with more than 1,000 inhabitants. Although mileage in places having more than 2,500 inhabitants was not originally included in Federal-aid programs, those places have been eligible for such aid in more recent years.

Q 56–58. Surfaced mileage, 1904–1970.

Source: 1904–1940, see first source for series Q 50–55; 1941–1970, see other sources for series Q 50–55.

High-type surfaced roads include bituminous penetration, sheet asphalt, bituminous concrete, portland cement concrete, vitrified brick, and block pavements of asphalt, wood, and stone. For some years, they also include dual-type surfaces and a small amount of unclassified mileage. Low-type surfaced roads include sand, clay, selected soil, untreated gravel, bituminous surface-treated, mixed bituminous and treated gravel, chert, shale, waterbound macadam.

Q 59–63. Mileage built by State highway departments, 1923–1970.

Source: 1920–1933, see first source for series Q 50–55; 1934–1970, see other sources for series Q 50–55.

Mileage built is mileage on which construction work creates a newly located road or is regarded as significantly improving the condition of an existing road. It does not include work designed to maintain or restore the condition of an existing road without material betterment. Mileage resurfaced or rebuilt to higher standards is the bulk of mileage built. Construction of earth roads consists of aligning, grading, and draining. See also text for series Q 56–58.

Q 64–68. Mileage and cost of Federal-aid highway systems, 1917–1970.

Source: **Series Q 64,** U.S. Federal Highway Administration, 1923–1965, *Highway Statistics, Summary to 1965;* 1966–1970, *Highway Statistics,* annual issues. **Series Q 65–68,** U.S. Bureau of Public Roads, 1917–1955, *Highway Statistics, Summary to 1955;* 1956–1965, *Highway Statistics,* annual issues; 1966–1970, see source for series Q 64.

In 1912, the Congress authorized $500,000 for an experimental program of rural post-road construction. However, it was not until the Federal-Aid Road Act of 1916 that the present cooperative Federal-State highway program was established on a continuing basis. In order to accelerate the improvement of the main traveled roads, Congress in 1921 authorized designation of a system of principal interstate and intercounty roads, limited to 7 percent of the total rural mileage then existing. The use of Federal aid was restricted to this system, and to rural mileage only.

Urban highway improvement first came in for its share of the Federal-State program when the Federal-Aid Highway Act of 1944 specifically authorized the use of funds for Federal-aid highways in urban areas. In addition, the Act provided for the designation of a Federal-aid secondary system and a National System of Interstate Highways. The Federal-Aid Highway Act of 1956 provided substantially increased sums for the Federal-aid primary and secondary systems for a 3-year period, and established a long-range plan for financing accelerated completion of the 41,000-mile interstate system.

Federal funds are available for expenditure only on the designated Federal-aid systems and, in general, must be matched by an equal amount of State funds. However, under the Federal-aid Act of 1954 the Federal share for the Interstate System was raised to 60 percent, and under the 1956 Act the proportion was increased to 90 percent. Federal aid may not be expended for maintenance. The cost of most Federal-aid projects is paid initially out of State highway funds, or in some cases by counties or other local governments. The Federal share is paid as reimbursement to the States as work progresses, with final payment made after completion.

Federal authorizations have usually been made on a biennial basis and apportioned among the States for use within a 3-year period. Figures for State funds shown here are based on legal matching ratios determined by applicable Federal-aid acts. In States having public lands in excess of 5 percent of their total area, the Federal share is proportionally increased.

Q 69–81. Class I intercity motor carriers of passengers and property, 1939–1970.

Source: U.S. Interstate Commerce Commission, *Transport Statistics in the United States,* part 7, annual issues.

Prior to 1950, class I for-hire motor carriers were classified by the Interstate Commerce Commission as those with $100,000 or more of gross annual operating revenue; for 1950–1958, those having gross operating revenue of $200,000 for a 3-year period; and, beginning 1969, those having gross operating revenue of $1,000,000 for a 3-year period.

Q 82–96. State highway finances, 1890–1970.

Source: 1890–1920, see first source for series Q 50–55; 1921–1970, see other sources for series Q 50–55.

A State highway-user tax is defined as a special tax or fee (except tolls) levied upon motor-vehicle users because of their use of the highways. Highway-user taxes include motor-fuel taxes, motor-vehicle registration and associated fees, and special taxes applicable only to motor carriers; these taxes are separable and apart from property, excise, business, or other taxes paid by the general public.

In many States, specific portions of the revenue from each type of highway-user tax are allocated to particular highway purposes. A number of States, however, place all highway-user revenue in a highway fund, and a few have a general State fund into which go all types of revenue. For the latter group of States, each particular appropriation or expenditure for highway purposes is considered to have been made from motor-fuel taxes, motor-vehicle registration fees, and motor-carrier taxes in proportion to the relative amount of revenue received from each of these three sources.

The largest share of receipts from State highway-user taxes is expended on State highways, but a portion is also allocated for local roads and streets, and a small amount used for nonhighway purposes.

Q 97–112. Receipts and disbursements of highway funds by counties and townships, 1921–1970.

Source: U.S. Federal Highway Administration, 1921–1964, *Highway Statistics, Summary to 1965,* tables LF-201 and LF-202; 1965–1970, *Highway Statistics,* annual issues, tables LF-1 and LF-2.

Q 113–128. Receipts and disbursements of highway funds by municipalities, 1921–1970.

Source: U.S. Federal Highway Administration, 1921–1964, *Highway Statistics, Summary to 1965,* tables UF-201 and UF-202; 1965–1970, *Highway Statistics,* annual issues, tables UF-1 and UF-2.

Q 129–135. Highway construction—contracts awarded, 1947–1970.

Source: U.S. Bureau of Domestic Commerce (formerly Business and Defense Services Administration), *Construction Review,* various issues.

Highways include streets, roads, alleys, bridges, vehicular tunnels, viaducts, sidewalks, curbs, and gutters, except when installed by private builders as a part of land development; forest and park roads; new culverts and extension of old culverts; right-of-way drainage, erosion control, lighting, and guard rails; and earth-work protective structures in connection with road improvements.

The data for State and locally owned highways were compiled by the Bureau of Domestic Commerce (formerly the Business and Defense Services Administration), Department of Commerce, from: (1) Information published by a number of private construction news services; (2) information received from selected State and local government agencies; and (3) data compiled by the Bureau of Public Roads (now the Federal Highway Administration) and the Bureau of Labor Statistics.

Data on contracts awarded for federally owned construction were compiled by BLS from reports submitted by the various Federal agencies having construction operations.

Q 136–147. Public highway debt—long-term highway obligations of State and local governments, 1945–1970.

Source: U.S. Federal Highway Administration (formerly Bureau of Public Roads), releases.

Q 148–151. Motor-vehicle factory sales, 1900–1970.

Source: Automobile Manufacturers Association, *Automobile Facts and Figures*, various issues.

Production of passenger cars was discontinued in February 1942 to economize resources for World War II purposes, but some vehicles remaining in factory stocks were sold under rationing orders in subsequent war years. The War Production Board authorized resumption of production as of July 1, 1945, but no new cars were actually produced until 1946.

Q 152–155. Motor-vehicle registrations, 1900–1970.

Source: U.S. Federal Highway Administration, 1900–1965, *Highway Statistics, Summary to 1965;* 1966–1970, *Summary of Motor Vehicle Registrations by Years*, table MV-200, and unpublished data.

Figures are based on reports and unpublished data of State motor-vehicle registration departments. They include both privately and publicly owned vehicles.

Motor-vehicle data for the early years of the century are incomplete, largely because few States required their registration, and hence had no records of the number of vehicles using roads and streets. As production of vehicles increased, shortly before the first World War, so did the number of registration laws. By 1921, all States had adopted some form of motor-vehicle registration.

Accompanying the growth in motor-vehicle registrations has been a corresponding diversity in the registration practices among the States. In general, motor vehicles are classified as private passenger cars, passenger carriers for hire, trucks, trailers, motorcycles, and property carriers for hire. Several States, however, still register buses with either trucks or passenger cars. These differences have made it necessary for the data-compiling agency to supplement the data submitted by the States with information obtained from special studies and from other sources.

Q 156–162. Motor-fuel usage, 1919–1970.

Source: U.S. Federal Highway Administration, 1919–1965, *Highway Statistics, Summary to 1965;* 1966–1970, *Analysis of Motor Fuel Consumption*, table G221, and unpublished data.

Fuel consumption figures for which reports from State authorities were not available have been estimated by the Federal Highway Administration (formerly Bureau of Public Roads). Motor fuel includes all gasoline used for any purpose (private and public), except military, plus any diesel or other fuels used solely for the propulsion of motor vehicles on public highways. Exports from the United States are excluded, and there is no duplication because of interstate shipment. Tractor fuels are not included. Nonhighway consumption includes all use off the highway, such as aviation, agriculture, marine, industrial, etc., and usually falls under the exemption or refund provisions of the motor-fuel tax law.

Q 163–174. Automobile insurance, 1946–1970.

Source: The Spectator, Philadelphia, 1946–1954, *Insurance Yearbook*; 1955–1965, *Insurance by States*; 1966–1969, *Property Liability Insurance Review*, annual. 1970, The National Underwriter Co., Cincinnati, *Argus F.C. & S. Chart*, annual (copyright).

Q 175–186. Percent distribution of automobile ownership, and financing, 1947–1970.

Source: The University of Michigan, Survey Research Center, Ann Arbor, *Survey of Consumer Finances* (copyright).

Q 187–198. Speed of motor vehicles on highways, 1945–1970.

Source: U.S. Federal Highway Administration, *Traffic Speed Trends*, and unpublished data.

Comparatively few speed studies were conducted on main rural highways until immediately prior to World War II. At that time, the average speeds of trucks, passenger cars, and buses were 41, 48, and 51 miles/hour, respectively. The low average speeds during World War II resulted from wartime restrictions on travel speeds and from gasoline rationing.

Speeds of passenger cars did not return to their prewar level until 1947. Trucks reached their prewar level in 1946, and buses in 1948. From 1948 through 1950 there was little change in vehicle speeds. Since then speeds consistently increased until 1970.

Q 199–205. Miles of travel by motor vehicles, 1921–1970.

Source: 1921–1935, U.S. Federal Works Agency, unpublished data, and U.S. Public Roads Administration, unpublished data; 1936–1965, see U.S. Federal Highway Administration sources for series Q 50–55.

Traffic volume information is obtained from automatic traffic recorders operating continuously at selected locations on the roads and streets of each State. The recorders are generally supplemented by periodic manual classification counts to determine the proportion of vehicles of each type, and each highway category, and by portable machine counts on the many road and street sections.

Q 206–207. Average miles of travel per vehicle, 1936–1970.

Source: See U.S. Federal Highway Administration sources for series Q 50–55.

Q 208–223. Motor-vehicle deaths and death rates, by age, 1913–1970.

Source: National Safety Council, Chicago, *Accident Facts, 1969*, p. 60; and *1974*, p. 60 (copyright).

Data for 1913 to 1932 were calculated from U.S. National Center for Health Statistics data for registration States. Data for 1933 to 1963, 1965 to 1967, 1969, and 1970 are national totals; those for 1964 and 1968 are National Safety Council estimates.

Q 224–232. Motor-vehicle accidents—number and deaths, by type of accident, 1913–1970.

Source: National Safety Council, Chicago, *Accident Facts, 1974*, and various annual issues (copyright).

Q 233–234. State and Federal gasoline tax rates, 1930–1970.

Source: See U.S. Federal Highway Administration sources for series Q 50–55.

State average tax is weighted by net gallons taxed at the various rates in the several States. No data are shown before 1930 because it was the first year in which all States had motor fuel taxes in effect for the whole year.

The precise dates of the changes in the Federal tax are as follows: June 21, 1932, 1 cent; June 17, 1933, 1.5 cents; January 1, 1934, 1 cent; July 1, 1940, 1.5 cents; November 1, 1951, 2 cents; July 1, 1956, 3 cents; October 1, 1959, 4 cents.

Q 235–250. Public transit mileage, equipment, passengers, and passenger revenue, 1917–1970.

Source: American Transit Association, *Transit Fact Book*, various annual issues (copyright); *The Transit Industry in the United States, Basic Data and Trends*, 1943 (copyright); mimeographed release on number of passengers, January 3, 1938.

Figures are estimates based on reports for more than 85 percent of the industry, which includes local motorbuses, electric street railways, elevated and subway lines, interurban electric railways, and transit coach lines.

Mileage estimates for trolley coaches, series Q 236, are miles of negative overhead wire. Mileage estimates for motorbuses, series Q 237, are miles of route, round trip. Equipment owned, railway cars, series Q 238, includes surface, subway, and elevated cars. The estimates for 1933 and 1934 for motorbuses owned, series Q 240, are probably understated. Revenue and nonrevenue passenger figures, series Q 241–244, exceed revenue passenger figures, series Q 245, chiefly because of free transfers.

Q 251–263. Oil pipelines operated and oil originated, 1921–1970.

Source: U.S. Interstate Commerce Commission, 1921–1953, *Statistics of Railways in the United States*, various annual issues; 1954–1970, *Transport Statistics in the United States*, part 6, *Oil Pipe Lines*.

Figures refer to pipelines operating in interstate commerce and regulated by ICC. Crude oil originated, series Q 252, includes both gathering and trunk lines.

For a discussion of statistics of oil pipelines, see ICC, *A Review of Statistics of Oil Pipe Lines, 1921–1941*, Statement 4280, mimeographed, 1942. The figure for mileage in 1938, which appears to have been revised, is from this Statement.

Figures for barrels of oil carried are as follows, in millions: 1925, 831; 1926, 836; 1927, 989; 1928, 1,053; 1929, 1,156; 1930, 1,172; 1931, 987. In these figures, a barrel handled by two or more pipelines in succession is counted each time it is handled. In the figures for barrels originated, this duplication is avoided.

★★★★★★★★★ **More Recent Data for *Historical Statistics* Series** ★★★★★★★★★

Statistics for more recent years in continuation of many of the still-active series shown here appear in annual issues of the ***Statistical Abstract of the United States,*** beginning with the 1975 edition. For direct linkage of the historical series to the tables in the ***Abstract,*** see Appendix I in the ***Abstract.***

Series Q 1–11. Volume of Domestic Intercity Passenger Traffic, by Type of Transport: 1950 to 1970

[**In billions of passenger-miles, except percent.** Airways, prior to 1959, and other types of transportation, prior to 1960, exclude Alaska and Hawaii. A passenger-mile is the movement of 1 passenger for the distance of 1 mile. Comprises public and private traffic, both revenue and nonrevenue]

Year	Total traffic, volume	Private automobiles		Airways [1]		Buses [2]		Railroads [3]		Inland waterways [4]

[1] Includes domestic commercial revenue service and private pleasure and business flying.
[2] Excludes schoolbuses.
[3] Includes electric railways.
[4] Includes Great Lakes.

Series Q 12–22. Volume of Domestic Intercity Freight Traffic, by Type of Transport: 1939 to 1970

[**In billions of ton-miles, except percent.** Motor vehicles and airways, prior to 1959, and other types of transportation, prior to 1960, exclude Alaska and Hawaii, except as noted. A ton-mile is the movement of 1 ton (2,000 pounds) of freight for the distance of 1 mile. Comprises public and private traffic, both revenue and nonrevenue]

Year	Total traffic, volume	Railroads [1]		Motor vehicles		Inland waterways [2]		Oil pipelines		Airways [3]

Z Less than 50 million ton-miles, or less than 0.05 percent.
[1] Includes electric railways, express, and mail.
[2] Includes Great Lakes. Includes Alaska for all years and Hawaii beginning 1959.
[3] Domestic revenue service only. Includes express, mail, and excess baggage.
[4] Part of this increase resulted from coverage of waterways previously existing but not covered.

Series Q 23–35. Operating Revenues, by Type of Transport: 1936 to 1970

[Excludes Alaska and Hawaii, except as noted]

* Denotes first year for which figures include Alaska and Hawaii.

[1] The electric railway decrease is overstated through the years because of noncomparability of reporting.

[2] Through 1969, excludes payments to others for express privileges.

[3] Includes pullman (prior to 1965), line-haul, and switching and terminal companies.

[4] Includes only revenues from domestic traffic of carriers under jurisdiction of Interstate Commerce Commission.

[5] Revenues for scheduled passenger cargo operations.

[6] Includes Hawaii for all years and Alaska beginning 1955.

[7] Beginning 1960, includes operations in Alaska.

* Denotes first year for which figures include Alaska and Hawaii.

[1] Covers establishments furnishing local or long-distance trucking, transfer, and draying services, or engaged in storage of farm products, furniture and other household goods, or commercial goods. Includes terminal facilities for handling freight.

[2] Includes companies furnishing transportation by line-haul railroad and certain allied services, such as sleeping and dining car services, railway express, and switching and terminal companies.

[3] Covers certificated and noncertificated air carriers engaged in passenger and cargo or freight transportation. Excludes employment in related facilities and services.

[4] Covers companies or systems primarily engaged in furnishing passenger transportation confined principally to a municipality, contiguous municipalities, or a municipality and its suburban areas, including transportation by railway but excluding taxicab, schoolbus, and charter service.

[5] Covers intercity, interurban, and interstate bus lines, and includes intercity motor vehicle passenger transportation not operated on regular schedules.

* Denotes first year for which figures include Alaska and Hawaii.
NA Not available.

[1] Includes municipal extensions of county, town, and township roads prior to 1962, and mileage in National and State parks, forests, reservations, etc. prior to 1936 that were not parts of State or local systems.

[2] Includes mileage in National and State parks, forests, reservations, etc. that did not form parts of State or local road system. Prior to 1936 these roads were included with county, town, and township roads.

[3] Includes all surfaced mileage whether under State or local control.

[4] Includes State highway extensions within cities.

[5] Excludes mileage of local roads and streets on Federal-aid secondary system which were built by State highway departments or by local authorities when financed partially or entirely by Federal funds.

* Denotes first year for which figures include Alaska and Hawaii.
[1] Includes estimates on Federal-aid primary system throughout, Federal-aid secondary systems beginning in 1942, and national system of interstate and defense highways beginning in 1951. Estimates as of end of calendar year.
[2] Comprises new and rebuilt mileage.
[3] Represents actual expenditures of funds on calendar-year basis. Beginning 1935, includes money spent on public works and defense highways. Beginning 1940, includes secondary highways.

* Denotes first year for which figures include Alaska and Hawaii.
Z Less than 50,000.
[1] Includes road, bridge, and ferry tolls; property taxes; appropriations from general funds; and other State imposts.
[2] Includes funds of Federal Highway Administration and other agencies paid as reimbursement to the States. Does not include direct Federal expenditures for highways.
[3] Includes refunding issues and toll revenue bonds.
[4] Includes funds transferred from local governments and miscellaneous receipts.
[5] Beginning 1966, excludes amounts allocated for collection and nonhighway purposes, and bonds redeemed by refunding.
[6] Includes administration, engineering, and equipment; State highway police; interest on obligations for State highways; and retirement of obligations for State highways.
[7] Includes expenditures and funds transferred for nonhighway purposes and expense of collecting and administering highway-user revenue.

Series Q 97–112. Receipts and Disbursements of Highway Funds by Counties and Townships: 1921 to 1970

– Represents zero.

[1] Includes long and short-term notes. The latter are for two years or less.

[2] Beginning 1940, includes small amount from municipalities, not shown separately.

[3] Includes Federal work-relief funds (mainly Works Progress Administration) for 1933–42 respectively, as follows (in millions of dollars): 25, 150, 91, 339, 221, 389, 352, 295, 189, and 78.

[4] Includes expenditures by local rural agencies for highways. The major share of the expenditures were for the local highway system. However, in some instances, outlays for State-administered highways and local city streets are included.

[5] For 1931–1959, includes small amount for nonhighway purposes, not shown separately.

[6] Includes debt service for long and short-term notes. The latter are for two years or less.

* Denotes first year for which figures include Alaska and Hawaii.
[1] Excludes refunding issues.
[2] Excludes redemptions by refunding.
[3] Duplicated and interunit obligations have been excluded from totals only.

Series Q 148–162. Motor-Vehicle Factory Sales and Registrations, and Motor-Fuel Usage: 1900 to 1970

[Number sold includes sales of military vehicles. Value of sales does not include Federal excise taxes. Beginning 1937, standard equipment is included in the value estimate]

Year	Motor-vehicle factory sales				Motor-vehicle registrations				Motor-fuel usage

* Denotes first year for which figures include Alaska and Hawaii.
Z Less than $500,000.
[1] A substantial portion of the number of trucks and buses (series Q 150) consists of chassis only, without bodies; hence the value of bodies for these chassis (series Q 151) is not included.
[2] Beginning 1942, includes travel by military vehicles.

Series Q 163–174. Automobile Insurance: 1946 to 1970

[**Money figures in millions of dollars.** 1950, net basis; 1955, direct writing basis; 1960 and 1965, direct premiums earned and direct losses incurred; 1969, premiums written basis; 1970, premiums earned basis]

[1] Refers to purchases during preceding year. Includes cars received as gifts, whether cash or credit purchased. Detail in purchases excludes buyers for whom method of financing was not ascertained.
[2] Includes trade-in allowance.
[3] Based on spending units (persons living in the same dwelling and related by blood, marriage, or adoption) who pooled their income for major items of expense.

Series Q 187–198. Speed of Motor Vehicles on Highways: 1945 to 1970

[Excludes Alaska and Hawaii. Based on actual speed of each vehicle recorded on tangent sections of main rural highways during off-peak hours]

Year	Vehicles recorded (1,000)	Average speed (m.p.h.)				Percent of vehicles exceeding—						
		All vehicles	Passenger cars	Trucks	Buses	40 m.p.h.	45 m.p.h.	50 m.p.h.	55 m.p.h.	60 m.p.h.	65 m.p.h.	70 m.p.h.

[1] Based on populations standardized for age (base 1940) to remove influence of changes in age distribution that occurred between 1913 and 1969.

[2] Includes "age unknown." In 1967, those deaths numbered about 23.

1959*	5.86	3-4	1944	4.06	1.5			
1958	5.65	3	1943	4.05	1.5			
1957	5.58	3	1942	3.99	1.5			
1956	5.54	2-3	1941	3.99	1.5			

* Denotes first year for which figures include Alaska and Hawaii.

[1] The 4-cent gasoline tax applies to all gallonage imported or produced. Effective July 1, 1955, the entire tax became refundable for fuel used for farming; thereafter, the additional two cents (one cent levied July 1, 1956, and one cent levied Oct. 1, 1959) became refundable for nonhighway uses, and for use by local transit systems.

Series Q 235–250. Public Transit Mileage, Equipment, Passengers, and Passenger Revenue: 1917 to 1970

Year	Mileage (Dec. 31)			Equipment owned (Dec. 31)			Revenue and nonrevenue passengers (millions)				Revenue passengers (mil.)	Passenger revenue (mil. dol.)	Employees (1,000)	Employee payroll (mil. dol.)	Passengers carried, railway (millions)	
	Railway track	Trolley coach	Motor bus	Railway cars	Trolley coaches	Motor buses	Total	Railway	Trolley coach	Motor bus					Surface	Subway and elevated

Chapter Q

Rail Transportation (Series Q 264-412)

Q 264–412. General note.

The principal sources of these series are various issues of two annual publications of the Interstate Commerce Commission: For 1954–1970, *Transport Statistics in the United States*, part 1; and for all years prior to 1954, *Statistics of Railways in the United States*.

No attempt has been made to adjust the figures for the effect of changes in methods of accounting and reporting; hence, the data for the various years are often only approximately comparable.

Although railroads regulated by the ICC are still described legally as "steam railways," most train and switching operations, since 1957, are performed by diesel locomotives, and some divisions of the railways included are electrified. The Commission has also regulated a small and diminishing number of railways of the interurban electric type which are not included in the figures shown here.

Railway *operating* companies are those whose officers direct the actual transportation service and whose books contain operating as well as financial accounts. *Lessor* companies maintain a separate legal existence, but their properties are operated by the lessees. *Proprietary* companies are also nonoperating companies. Their outstanding capitalization is owned by other railway companies. The term "circular" refers to roads (operating or nonoperating) for which brief circulars showing date of incorporation, mileage, and a few other facts were filed with the Interstate Commerce Commission. They include intrastate roads and roads under construction. The term "unofficial" is used to indicate roads for which official returns were not received by the ICC—the figures having been taken from the returns by roads in prior years, and items contained in railway and engineering periodicals and newspapers, corrected in accordance with the best information available.

Switching and terminal companies are those operating separately for joint account or for revenue. Services such as those of switching and terminal companies are mostly performed directly by the line-haul carriers as an ordinary part of their business. Line haul denotes train movements between terminals and stations on main and branch lines of the road, exclusive of switching.

Beginning in 1911, the ICC classified operating companies on the basis of operating revenues. Those of class I had annual revenues above $1,000,000; class II, above $100,000; and class III, below $100,000. Beginning in 1956, the minimum for class I was raised to $3,000,000 and the other two classes were consolidated. Effective January 1965, the classification was changed to the following: Class I, $5,000,000 or more; and class II, under $5,000,000. If the revenues of a company fall below the limit, the company is not reclassified until the decline appears to be permanent. The relative importance of class I railroads has increased since 1911 because of the growth of traffic and the absorption of small roads in larger systems. The ratio of operating revenues of class I line-haul companies to the total revenues of classes I, II, and III was 96.48 percent in 1911, 97.45 in 1916, 98.07 in 1926, 98.76 in 1941, 99.06 in 1945, and 98.21 in 1969.

A collection of definitions of words or phrases frequently used in discussions of railway statistics has been issued by the ICC, entitled *Railway Statistical Terms*, Statement No. 4119, June 1941. For financial terms, see ICC, *Uniform System of Accounts for Steam Railroads*.

Statistics of mileage in existence and stocks of equipment, and balance sheet items, pertain to the end of the year indicated.

There are no class I railroads in Alaska or Hawaii.

Q 264–273. Electric railways—summary, 1890–1937.

Source: U.S. Bureau of the Census, *Census of Electrical Industries, Report on Street Railways and Trolley-Bus and Motorbus Operations.*

The census of street railways, which was first taken in 1890, and which was taken at quinquennial intervals from 1902 through 1937, covers all street railways, without regard to kind of motive power, and all interurban railways using other than steam as motive power. The nonelectric railroads included are those operated principally by cable and gasoline engines. Operations of electrified divisions of steam-railway companies are not included. Figures in these series do not include data for motorbus and trolley-bus operations of electric street railways. For motorbus and trolley-bus statistics from census reports, see source.

Q 274–282. Railroad passenger and freight service, 1865–1890.

Source: U.S. Interstate Commerce Commission, *Railway Statistics Before 1890*, Statement No. 32151 (mimeographed), 1932.

Before 1890, the principal source of continuous information on railroads is the annual *Poor's Manual of Railroads*. The figures in the *Manual* were revised in successive issues. The Interstate Commerce Commission consulted the issues from 1869 to 1900 and evidently took account of the revisions. Earnings and traffic figures are understatements of actual level; mileage covered is shown in the table below. Similar but not identical figures, with the degree of coverage similarly indicated in terms of mileage, appear in Bureau of the Census, *Report on Transportation Business in the United States at the Eleventh Census*, 1890, part I.

Table I. Miles of Road Operated by Railroads

Year	Roads reporting earnings [1]	Roads reporting earnings and traffic statistics	Year	Roads reporting earnings [1]
1890	158,037	157,976	1879	79,009
1889	153,945	153,689	1878	78,960
1888	145,387	145,341	1877	74,112
1887	137,028	136,986	1876	73,508
1886	125,185	125,146	1875	71,759
1885	123,320	122,110	1874	69,273
1884	115,704	113,172	1873	66,237
1883	110,414	106,938	1872	57,323
1882	104,971	95,752	1871	44,614
1881	92,971	----		
1880	82,146	----	1851	8,836

[1] Includes elevated railways.

All figures are based on reports of individual railroads for fiscal years ending in the calendar year indicated. The period of time covered is, therefore, not the same for all carriers included. Balance sheet data pertain to the ends of such fiscal years.

Data for 1890 shown in these series do not agree with 1890 data shown for series Q 284–312 because of different sources.

Q 283. Freight service, ton-miles carried, 13 railroads, 1865–1885.

Source: H. V. and H. W. Poor, *Manual of Railroads*, New York City, 1888, p. XXVIII (reprinted with permission, Standard & Poor Corporation).

The roads represented are 7 eastern roads (Pennsylvania; Pittsburgh, Fort Wayne, and Chicago; New York Central; Lake Shore; Michigan Central; Boston and Albany; New York, Lake Erie and Western) and 6 western roads (Illinois Central; Chicago and Alton; Chicago and Rock Island; Chicago, Burlington and Quincy; Chicago and Northwestern; Chicago, Milwaukee, and St. Paul).

Q 284–312. Railroad mileage, equipment, and passenger traffic and revenue, 1890–1970.

Source: All series, except series Q 293–294, see general note for series Q 264–412. **Series Q 293,** 1913–1970, and **series Q 294,** 1911–1956, American Railway Car Institute, New York, *Railroad Car Facts,* annual issues (copyright); **series Q 294,** 1957–1970, U.S. Interstate Commerce Commission, *Transport Statistics in the United States,* part 1, annual issues.

Q 285, mileage constructed. Miles on which operations were begun during the year. Figures exclude relocated road or road constructed to shorten distance without serving new territory.

Q 286, mileage abandoned. Miles on which operation was permanently abandoned during the year, the cost of which was written out of the investment accounts or was scheduled to be written out at the end of the year.

Q 289, track operated, first main track. Equivalent to miles of road operated. Figures exceed those for series **Q 287,** road owned, in most years because of two or more roads operating on same line under trackage agreements.

Q 300, average tractive effort. Figures represent the force in pounds exerted by locomotives, measured at the rim of the driving wheels.

Q 301–303, passenger-train cars. Includes coaches and parlor, sleeping, dining, club, lounge, observation, postal, baggage, express, and other cars, as well as cars serving a combination of purposes.

Q 311, passenger revenue. Excludes revenue from services such as handling of excess baggage or mail; sleeping and parlor or chair car reservations; dining and buffet service on trains; station, train, and boat privileges; parcel rooms; storage of baggage; or other miscellaneous services and facilities connected with the transportation of passengers. Passenger revenue depends upon the established tariffs (the published schedules of rates and fares) and includes extra fares on limited trains, additional railway fares for the exclusive use of space, mileage and scrip coupons honored, or revenue from the transportation of corpses.

Q 312, revenue per passenger mile. Represents figures for series Q 311 divided by those for series Q 307.

Q 313–314. Railroad revenue passenger-miles per car-mile and per train-mile, 1890–1970.

Source: U.S. Interstate Commerce Commission, 1890–1965, *Revenue Traffic Statistics,* December issues; 1966–1970, *Transport Economics,* June 1970, and unpublished data.

Figures for revenue passenger-miles per car-mile for 1908–1919, and for passenger-miles per train-mile for 1890–1932, were computed by the National Bureau of Economic Research from figures for passenger-miles, car-miles, and train-miles presented in *Statistics of Railways in the United States.*

Q 315. Passenger train-miles per train-hour, 1936–1970.

Source: U.S. Interstate Commerce Commission, 1936–1957, *Passenger Train Performance,* December issues; 1958–1968, *Annual Report,* 1968 and 1969; 1969 and 1970, *Transport Economics,* June 1970, and unpublished data.

The train-hour figures upon which these figures are based are reckoned from the time a train leaves its original terminal to the time it arrives at its final terminal. Time spent in stopping to take on and discharge traffic and other delays on the road is included.

Q 316–318. Railroad freight revenue ton-miles per loaded car-mile, train-mile, and mile of road, 1890–1970.

Source: See general note for series Q 264–412.

Q 319. Freight train-miles per train-hour, 1920–1970.

Source: U.S. Interstate Commerce Commission, 1920–1955, *Freight Train Performance,* December issues; 1956–1965, *Annual Report,* 1967 and 1969; 1966–1970, *Transport Economics,* June 1970, and unpublished data.

For explanation of train-hour figures, see text for series Q 315.

Q 320. Freight car-miles per car-day, 1921–1970.

Source: U.S. Interstate Commerce Commission. See general note for series Q 264–412; 1956–1962, *Annual Report,* various issues; 1963–1965, *Transport Statistics in the United States,* 1967; 1966–1970, *Transport Economics,* June 1970, and unpublished data.

Q 321–328. Railroad mileage and equipment, 1830–1890.

Source: See source for series Q 274–282.

Equipment data pertain to the ends of fiscal years. See also text for series Q 274–282.

Q 329. Miles of railroad built, 1830–1925.

Source: 1830–1879, U.S. Bureau of the Census, Tenth Census Reports, vol. IV, *Report on the Agencies of Transportation in the United States,* p. 289. 1893–1925, *Railway Age,* vol. 104, No. 1, Simmons-Boardman Publishing Corp., New York, January 1, 1938, p. 66 (copyright).

For a more detailed discussion of the problems of estimating miles of railroad built, see E. R. Wicker, "Railroad Investment Before the Civil War," and the "Comment" by George R. Taylor and by Charles J. Kennedy, in *Studies in Income and Wealth,* vol. 24, National Bureau of Economic Research, New York.

The Tenth Census report (pp. 289–293, 300–375) contains materials on history of construction which includes figures on mileage built and existent, by groups of States, for individual companies, annually from 1830 to 1880. Somewhat similar data appear in Bureau of the Census, *Report on Transportation Business in the United States at the Eleventh Census: 1890,* part 1, pp. 3–5, 54–107.

According to the Bureau of the Census, information was received from every railroad known to exist in 1880. The letter of instructions from the Superintendent of the Census to the railroads said: "In cases . . . in which the records have been lost, the officers of such companies and roads are requested to obtain . . . this information in the best form possible. The recollection of officers and employees long in the service of a road may be used . . . if more reliable data be not accessible."

The *Railway Age* obtained its figures at annual intervals from individual railroads and from State railroad commissions.

It is not clear just when a mile of road would be reported as built. Construction of some lines extended over several years. Each annual segment may have been reported when finished, or nothing may have been reported until the whole line was completed. The year of physical completion may have differed from the year in which traffic was first carried. In such cases, the mileage may have been assigned to either year.

The Census Bureau figures pertain only to miles in operation in the census year. The figures for any year are, therefore, understatements to the extent that mileage constructed in that year may have been abandoned by June 1, 1880 (the date of the 1880 Census).

The change from year to year in miles operated, series Q 321, or miles owned, series Q 322, is sometimes used as a measure of miles constructed. The annual change in miles operated, however, is also affected by acquisitions of trackage rights, as a result of which the same line may be counted in the operation of two or more railroads. The changes in miles operated and in miles owned are affected by abandonments during the year (regardless of when constructed).

Q 330. Miles of railroad operated by receivers or trustees, 1894–1970.

Source: See general note for series Q 264–412.

Q 331–345. Railroad freight traffic and revenue, 1890–1970.

Source: See general note for series Q 264–412 except series Q 331, 332, and 338, 1964–1970, from U.S. Interstate Commerce Commission, *Freight Commodity Statistics of Class I Railroads in the United States*, annual issues.

Revenue-tons and ton-miles exclude the movement of a railroad company's materials and supplies on its own lines. A carload is a shipment of 10,000 pounds or more of one commodity from one shipper to one consignee.

Tons originated are tons identified as not having had previous line-haul transportation by other rail carriers; such shipments include import traffic and traffic from outlying possessions of the United States received from water carriers at the port of entry, and finished products from transit points. Ton-miles are computed by multiplying the weight of each shipment by the distance it moves and summing the products.

For definitions of class I, II, and III roads, see general note for series Q 264–412.

Q 333, products of agriculture. Includes not only raw farm products but simple manufactures such as flour, corn meal, cottonseed meal, cake, and linters. On the other hand, such products as vegetable oils, sugar and molasses, canned fruits and vegetables, and manufactured tobacco are included in series Q 337, manufactures and miscellaneous.

Q 335, products of mines. Includes coke as well as coal and other raw minerals.

Q 336, products of forests. Includes not only raw forest products but lumber, shingles, lath; box, crate, and cooperage materials; veneer and built-up wood.

Q 343, freight revenue. Includes revenue from the transportation of freight and from transit, stop, diversion, and reconsignment arrangements upon the basis of tariffs. Excludes revenue from such activities as switching of freight-train cars; water transfers of freight, vehicles, and livestock; movement of freight trains at a rate per train-mile or for a lump sum; storage of freight; demurrage; grain elevators; stockyards; or other miscellaneous services and facilities connected with the transportation of freight.

Q 346–355. Railroad property investment, capital, income, and expenses, 1850–1890.

Source: See source for series Q 274–282.

See also text for same series.

Q 356–363. Railroad property investment and capital, 1890–1970.

Source: See general note for series Q 264–412.

Q 356, investment, book value. Figures represent recorded value, in the accounts of carriers, of land, fixed improvements such as roadbed and track, rolling stock, maintenance machinery, etc., owned by them. Figures include property held under contract for purchase.

Q 357, depreciation reserve. Figures represent the accumulated accounting allowance for loss in service value not restored by current maintenance. The loss in value is incurred in connection with the consumption or prospective retirement of physical property in the course of service from causes against which carriers are not protected by insurance, which are known to be in current operation, and the effect of which can be forecast with a reasonable approach to accuracy.

Q 361, funded debt unmatured. Funded debt is debt maturing more than one year from date of issue.

Q 362, net capitalization. Figures represent railway capital outstanding, series Q 358, minus stocks and debt of railroad companies held by other railroad companies.

Q 364–366. Railroad capital expenditures for additions and betterments, 1921–1970.

Source: Association of American Railroads, 1921–1950, *Railroad Transportation*; 1951–1970, *Yearbook of Railroad Facts, 1971*.

Additions comprise: Additional facilities such as equipment (rolling stock), tracks, buildings and other structures; additions to such facilities, such as extensions to tracks, buildings and other structures; additional ties laid in existing tracks; and additional devices applied to facilities such as airbrakes applied to cars not previously thus equipped.

Betterments comprise improvements of existing facilities through the substitution of superior parts for inferior parts retired, such as the substitution of steel-tired wheels for cast wheels under equipment, the application of heavier rail in tracks, the strengthening of bridges by the substitution of heavier members, and the application of superior floors or roofs in buildings.

Q 367–377. Railroad income and expenses, and interest and dividends, 1890–1970.

Source: See general note for series Q 264–412.

Q 367, operating revenue. Includes revenue from freight, passenger, and other transportation and incidental services.

Q 368–370, operating expenses. Includes current depreciation.

Q 371, tax accruals. Taxes imposed by any form of government whether based on an assessed value of the property, on amounts of stocks and bonds, on earnings, income, dividends declared, payroll, number of passengers, quantity of freight, length of road, rolling stock, or other basis. Tax accruals do not include special assessments for street and other improvements, nor special benefit taxes such as water assessments.

Q 372, operating income. Figures represent net revenue from railway operations, series Q 367 minus series Q 368, less tax accruals, series Q 371.

Q 373, net operating income. Figures represent operating income, series Q 372, minus net payable balance of equipment and joint facility rents. The equipment rents deducted at this point are those for equipment leased for less than one year, or interchanged. They are usually on a per day or per mile basis.

Q 374, net income. Figures represent net operating income, series Q 373, plus other income, minus miscellaneous deductions and fixed and contingent charges. Fixed charges are mainly rent for leased roads and equipment (i.e., equipment leased for one year or more), and interest (except contingent interest).

Q 377, interest accrued on funded debt. Figures include interest not paid during year on debt in default of interest; they exclude interest on debt owed by the issuing company, or on debt incurred for new lines, extensions, additions or betterments, accrued before such property is completed or comes into service.

Q 378–384. Railroad tax accruals, 1921–1970.

Source: See general note for series Q 264–412.

Other taxes, series Q 384, are largely property taxes levied by State or local governments.

Q 385–387. Railroad highway grade crossings, 1925–1970.

Source: See general note for series Q 264–412.

Specially protected highway grade crossings, series Q 386, include crossings with operated gates, watchmen, or both, during at least part of the day, and those with audible signals, visible signals, or both; they exclude those with fixed signs only.

Q 388–397. Fuel received, ties and rails laid, and purchases by railroads, 1917–1970.

Source: **Series Q 388–393,** see general note for series Q 264–412. **Series Q 394–397,** Association of American Railroads, 1923–1964,

Railroad Transportation; 1965–1969, *Yearbook of Railroad Facts*, annual issues.

Q 388–390, fuel received. Figures include not only fuel for operation of trains but fuel for station, shop, or other use, except that figures for 1964–1970 include only the operation of locomotives and motorcars.

Q 391, new rails laid. Figures include both rails laid in replacement and rails laid in additional tracks, new lines, and extensions, except that figures for 1917–1926 include only rails laid in replacement.

Q 392–393, cross-ties laid. Figures for 1917–1926 include only ties laid in replacement. Of the total ties laid in 1927, 78,340,000 were in replacement. Treated ties are those which have been subjected to some preservative process, e.g., creosoting, before being placed in the track.

Q 398–399. Railroad employees and compensation, 1890–1970.

Source: See general note for series Q 264–412.

An employee is defined as a person in the service of a railroad, subject to its continuing authority to supervise and direct the manner of rendition of his service. Persons such as lawyers engaged to render only specifically defined service for specific cases and not under general or continuing retainer are not classed as employees. For 1890–1914, the number of employees represents the number on the payroll June 30. Thereafter, the nature of the figures included for the smaller (class II and III) roads is not clear in the source. For class I roads they appear to be averages of 4 quarterly counts, 1915–1920; and of 2 quarterly and 6 monthly counts, 1921; beginning 1922, they are averages of 12 monthly counts.

Q 400–409. Railroad accidents and fatalities, 1890–1970.

Source: U.S. Federal Railroad Administration, *Accident Bulletin*, annual issues (formerly issued by U.S. Interstate Commerce Commission), and related monthly reports.

Reportable railroad accidents are divided into three groups: (1) Train accidents, (2) train-service accidents, and (3) nontrain accidents. Train accidents are those arising from the operation or movement of trains, locomotives, or cars which result in a reportable death or injury and more than $750 damage to equipment, track, or roadbed; or a collision, derailment, or other train accident, with more than $750 damage to equipment, track, or roadbed. Train-service accidents are those arising from the operation or movement of trains, locomotives, or cars which result in a reportable death or injury but not more than $750 damage to equipment, track, or roadbed. Nontrain accidents are those which do not result from the operation or movement of trains, locomotives, or cars.

Q 410–412. Pullman company operations, 1915–1968.

Source: U.S. Interstate Commerce Commission, *Statistics of Railways in the United States* and *Transport Statistics in the United States*, part 2, and, beginning 1963, part 1, *The Pullman Company (Sleeping Car Companies)*, various annual issues; except series Q 411, 1915–1921, U.S. Office of Business Economics, *Survey of Current Business*, January 1939, p. 18.

Figures for series Q 411 exceed those in series Q 310, parlor and sleeping car passenger-miles, mainly because travel of railroad employees etc. (for which railroad companies receive no revenue) is not included in series Q 310; but if Pullman accommodations are paid for, the travel is included in series Q 411.

The number of Pullman employees, series Q 412, is the number on the payroll at the end of the year. The Pullman Company ceased operation in 1969.

★★★★★★★★★ **More Recent Data for *Historical Statistics* Series** ★★★★★★★★★

Statistics for more recent years in continuation of many of the still-active series shown here appear in annual issues of the ***Statistical Abstract of the United States***, beginning with the 1975 edition. For direct linkage of the historical series to the tables in the ***Abstract***, see Appendix I in the ***Abstract***.

Series Q 264–273. Electric Railways—Summary: 1890 to 1937

Series No.	Item	1937 [1]	1932	1927	1922	1917	1912	1907	1902	1890
264	Number of companies	[2] 478	[2] 706	[2] 963	[2] 1,200	[2] 1,307	1,260	1,236	987	789

NA Not available.

[1] Excludes data for 22 companies, operating on a part-year basis.

[2] Includes certain companies in Pennsylvania which maintained separate organizations, though controlled through stock ownership by other companies. For 1912, these companies were treated as merged and not included in the number reported.

[3] Includes small mileage of track lying outside United States.

[4] Number reported as of June 30 for 1890, 1922, 1927, and 1932; for 1902, average for the year; for 1912, as of Sept. 16. Figures for 1937 represent an average of numbers reported on June 30 and Dec. 31.

[5] Includes 334 trolley-bus operators.

[6] Includes 29,721,000 trolley-bus passengers.

[7] Includes auxiliary operating revenues of $91,242,000 for 1922 and $8,905,000 for 1927; auxiliary expenses, $49,232,000 for 1922 and $7,822,000 for 1927. Data for operating revenues and operating expenses of auxiliary operations excluded so far as possible for earlier years.

Series Q 274–283. Railroad Passenger and Freight Service: 1865 to 1890

* Denotes first year for which figures include Alaska and Hawaii.
[1] Includes circular and unofficial.
[2] First track. Includes lessors, proprietary, unofficial and, through 1963, circular companies.
[3] For railroads reporting track by class. Excludes circular and unofficial, figures for which cover road, first track only.
[4] Class I railroads.
[5] Includes switching and terminal companies.
[6] For 1890–1927, number of locomotives; for 1928–1970, number of units, except for steam locomotives. (A unit is the least number of wheel bases together with superstructure capable of independent propulsion, but not necessarily equipped with an independent control.)
[7] For 1915–1922, identified as "other than steam," but all or almost all of the locomotives must be electric.
[8] For 1916–1956, represents steam locomotives and freight cars of class I railroads excluding switching and terminal companies; for 1957–1967, includes all class I locomotives excluding switching and terminal companies.
[9] Included with "Other."
[10] Calendar-year data.
[11] Beginning 1969, excludes Pullman Co.
[12] Excludes caboose cars.
[13] Class I and II railroads.

Series Q 313–320. Railroad Passenger and Freight Operations: 1890 to 1970

[**Tons are of 2,000 pounds.** Class I, II, and III railroads except as follows: Series Q 313, class I beginning 1911; series Q 314, class I beginning 1933; and series Q 315, Q 319, Q 320, class I for all years]

* Denotes first year for which figures include Alaska and Hawaii.

[1] This average was obtained by dividing the revenue ton-miles by the total loaded car-miles, the latter item including some cars loaded with nonrevenue freight. The method is necessary to preserve comparability with figures for the earlier years; they differ slightly from the average "net tons per loaded car" shown in the regular monthly statements, *Freight and Passenger Service Operating Statistics*, based on revenue and nonrevenue ton-miles and car-miles.

[2] Class I and II railroads.

Series Q 321–328. Railroad Mileage and Equipment: 1830 to 1890

* Denotes first year for which figures include Alaska and Hawaii.

[1] Includes forwarder traffic beginning 1939.

[2] United States as a system, i.e., ton-miles or revenue of connecting roads is included in the numerator, but only tonnage originated in the denominator.

[3] Includes the following amounts of unassigned carload tonnage (thousands): 1911, 35,199; 1912, 32,266; 1913, 15,617; 1914, 14,671; 1915, 2,268; 1916, 1,367; and 1919, 338.

[4] Class I and II railroads.

Series Q 346–355. Railroad Property Investment, Capital, Income, and Expenses: 1850 to 1890

[In millions of dollars]

Year	Property investment and capital					Income and expenses			Interest and dividends	
	Investment in railroad and equipment	Stock, mortgage bonds, equipment, obligations, etc.			Stock paying dividends	Total traffic earnings	Operating expenses	Net earnings	Dividends paid	Interest paid on funded debt
		Total	Capital stock	Bonded debt

* Denotes first year for which figures include Alaska and Hawaii.
NA Not available.

[1] Increase in investment over a period of years cannot be obtained accurately by subtraction of 1 year's investment from that of another owing to reorganization, sale or abandonment, reclassification, etc. For 1921–1924, includes investment of lessor companies; and for 1925–1970, investment of lessor and proprietary companies.

[2] Includes depreciation on "Miscellaneous physical property" prior to 1920 and amortization of defense projects accrued in 1941–1950.

[3] Prior to 1958, includes securities nominally issued and nominally outstanding as well as those outstanding. Funded debt unmatured (series Q 361) does not include equipment obligations subsequent to 1942 but they are included here to preserve comparability of figures.

[4] Class I and II railroads and their lessor subsidiaries.

[5] Class I railroads.

[6] Includes $170 million estimated reserve for accrued depreciation to place figure on comparable basis with other years.

[7] Represents 1893 investments less increases each year on account of change in classification in 1893.

Series Q 367–377. Railroad Income and Expenses, and Interest and Dividends: 1890 to 1970

[**In thousands of dollars, except as indicated.** Includes intercorporate duplications. Unless otherwise noted, covers class I, II, and III railroads, subject to general exception that, prior to 1908, the returns for switching and terminal companies were included where applicable]

Year ending—	Income and expenses									Interest and dividends [1]	
	Operating revenue	Operating expenses			Tax accruals	Operating income	Net operating income	Net income [1]	Ratio of operating expenses to operating revenues (percent)	Dividends declared	Interest accrued on funded debt
		Total	Maintenance of way and structures	Maintenance of equipment

* Denotes first year for which figures include Alaska and Hawaii.
[1] Includes lessors.
[2] After extraordinary and prior period items.
[3] Includes $10,000 dividend declared from "capital surplus."
[4] Includes unusual items, amounting to $76,300,000, not representing cash.
[5] Class I and II railroads.
[6] Class I and II railroads and their lessor subsidiaries.

[1] 1939–1967 includes Pullman operations on Canadian and Mexican railroads; excludes chartered car operations.

Chapter Q

Water Transportation (Series Q 413-564)

Q 413–564. General note.

Basic governmental sources of historical merchant-marine and water-traffic statistics include *American State Papers: Class IV, Commerce and Navigation*, vols. 1 and 2, for 1789–1823; the various annual issues of *Foreign Commerce and Navigation of the United States*, for 1821–1946, originally issued by the Register of the Treasury and then by the Treasury Department, later by the Department of Commerce and Labor, and finally by the Department of Commerce; the *Annual Report of the Commissioner of Navigation*, 1884–1923, the issuance of which followed a similar succession beginning with the Treasury Department; annual issues of *Merchant Marine Statistics*, 1924–1965, originally prepared by the Department of Commerce as successor to the statistical section of the *Annual Report of the Commissioner of Navigation*, and issued annually by the Bureau of Customs until 1965, supplemented by records of the U.S. Coast Guard, and the various annual issues of the *Annual Report of the Office of the Chief of Engineers*, Corps of Engineers. The *Statistical Abstract of the United States*, a secondary source, also contains historical merchant-marine and water-traffic statistics. The *Statistical Abstract* has been issued by the following agencies: 1878–1902, Bureau of Statistics, Treasury Department; 1903–1911, Bureau of Statistics, Department of Commerce and Labor; 1912, Bureau of Foreign and Domestic Commerce, Department of Commerce and Labor; 1913–1937, Bureau of Foreign and Domestic Commerce, Department of Commerce; 1938 and thereafter, Bureau of the Census, Department of Commerce.

Congressional documents also contain historical series on the merchant marine, foreign commerce, and related fields. For 1789–1882, a particularly valuable collection of documents was found in the library of the Department of Commerce, bound together under the title *Decadence of American Shipping and Compulsory Pilotage.* The documents included are as follows: *Foreign Commerce and Decadence of American Shipping*, H. R. Ex. Doc. No. 111, 41st Congress, 2d session; *Causes of the Reduction of American Tonnage and the Decline of Navigation Interest . . .*, H. R. Report No. 28, 41st Congress, 2d session; *Foreign Commerce and the Practical Workings of Maritime Reciprocity*, H. R. Ex. Doc. No. 76, 41st Congress, 3d session; *Causes of the Decadence of Our Merchant Marine; Means for Its Restoration and the Extension of Our Foreign Commerce*, H. R. Report No. 342, 46th Congress, 3d session; *American Shipping*, H. R. Report No. 1827, 47th Congress, 2d session; *American Merchant Marine*, H. R. Report No. 363, 48th Congress, 1st session; *Ship-Building and Ship-Owning Interests*, H. R. Report No. 750, 48th Congress, 1st session; and reports of lesser interest, H. R. Misc. Doc. No. 37 and Report No. 1848, both of the 48th Congress, 1st session.

Since 1921, publications of the Maritime Commission and its predecessor agencies should also be consulted, particularly the reports entitled, *Ocean-Going Merchant Fleets of Principal Maritime Nations, Iron and Steel, Steam and Motor, Vessels of 2,000 Gross Tons and Over*, issued quarterly or semiannually, 1921–1941, and *Employment of American Flag Steam and Motor Merchant Vessels of 1,000 Gross Tons and Over*, issued quarterly, 1923–1941. Finally, the Bureau of the Census (and its predecessor Census Office) published the results of five censuses of water transportation, for the years 1880, 1889, 1906, 1916, and 1926 (see general note for series Q 414–505, below).

Q 413. Persons entering the United States by ship, 1933–1970.

Source: U.S. Department of the Treasury, *Annual Report of the Secretary of the Treasury on the State of the Finances*, various issues.

Data include persons entering by documented vessels, excluding ferryboats.

Q 414–505. General note.

Statistics on documented merchant vessels and shipbuilding are from *Merchant Marine Statistics*, various annual issues, supplemented by records of the U.S. Coast Guard. Many are from the 1936 issue. Some of the estimates from the 1936 report have been modified, however, as explained below in table II. The text statements, and the correction of errors found in the published tables are based on reference to the primary sources, as follows: For 1789–1823, see *American State Papers: Class IV, Commerce and Navigation*, vols. 1 and 2 (published in 1834); for 1821–1892, see annual issues of *Commerce and Navigation of the United States;* for 1884–1923, see issues of *Annual Report of the Commissioner of Navigation;* for 1924–1945, see annual issues of *Merchant Marine Statistics.*

Of the Maritime Commission reports cited in the general note for series Q 413–564, above, the first, *Ocean-Going Merchant Fleets. . .*, provides data for each leading maritime nation on ocean-going merchant vessels of 2,000 gross tons and over, showing number and tonnage of such fleets classified by age, speed, size, boilers, engines, draft, etc., by major vessel type. The second, *Employment of American Flag Steam and Motor Merchant Vessels . . .*, shows for seagoing merchant vessels of 1,000 gross tons and over the number and tonnage of such vessels employed in U.S. foreign and domestic trade, arranged by major vessel type, ownership (government and private), and area of operation.

Census statistics on water transportation are not presented here. For reports of these censuses, see *Tenth Census Reports*, vol. IV, *Report on Agencies of Transportation*, 1880; *Eleventh Census Reports, Report on Transportation Business*, part 1, "Transportation by Water"; *Transportation by Water, 1906; Water Transportation, 1916;* and *Water Transportation, 1926.*

The first census, for 1880, was limited to steam vessels. The report of this census includes a detailed history of steam navigation in the United States with separate discussion and single-year construction statistics by geographic region, from the beginning to 1880. (See T. C. Purdy, "Report on Steam Navigation in the United States," *Tenth Census Reports*, 1880, vol. IV.) The report of the shipbuilding census, also taken the same year, includes a detailed technical history of shipbuilding in all aspects, with particular reference to sailing craft. Single-year figures are shown for New England shipbuilding, 1674–1714, classified by type of vessel and place where built. (See Henry Hall, "Report on the Ship-Building Industry of the United States," *Tenth Census Reports*, 1880, vol. VIII.)

The censuses of 1889 and 1906 included all classes of vessels. However, the 1889 census included fishing vessels for the Pacific Division only and the 1906 census excluded fishing vessels. The censuses of 1916 and 1926 provided data for all U.S. vessels and craft of 5 tons net register and over, documented and undocumented, whether propelled by machinery or sails, or unrigged, except that certain specified types of vessels were excluded. (See Bureau of the Census, *Water Transportation, 1926*, p. 5.) While the census reports of 1850 and 1860 contain some statistics relating to water transportation, these statistics apparently were collected by other agencies.

Data shown here are for documented merchant vessels only, ex-

clusive of yachts. The following definitions are those currently applicable:

Documented vessels include all vessels granted registers, enrollments and licenses, or licenses, as "vessels of the United States," and as such have certain benefits and privileges. Vessels of 5 net tons and over owned by citizens of the United States and otherwise complying with the requirements for documentation may be documented to engage in the foreign or coasting trades or the fisheries.

Registers are ordinarily issued to vessels engaged in the foreign trade or the whale fisheries. Historically, this group has included the major portion of the whaling fleet.

Enrollments and licenses are issued to vessels of 20 net tons and over engaged in the coasting trade or fisheries.

Licenses may be issued to vessels of less than 20 net tons engaged in the coasting trade or fisheries.

Undocumented craft are those not registered, enrolled, or licensed. Barges, scows, lighters, and canal boats, without any propelling power of their own, operated exclusively in a harbor, on the canals or other internal waters of a State, or on the rivers or lakes of the United States, not in any case carrying passengers, and vessels under 5 net tons are exempt from the requirements of the laws governing documentation.

Gross tonnage refers to *space* measurement, 100 cubic feet equaling 1 ton; it is not a measure of weight. Gross tonnage is the capacity of the entire space within the frames and the ceiling of the hull, together with those closed-in spaces above deck available for cargo, stores, passengers, or crew, with certain minor exemptions. Before 1865, 95 cubic feet equaled 1 ton, and the admeasurement method differed in other respects.

Changes in maritime law: Admeasurement method. "Admeasurement" refers to the method of calculating gross tonnage of ships or vessels. The first law of the United States on the subject appears to have been enacted September 1, 1789 (1 Stat. 55). The enactment then made was reenacted with certain minor amendments in the Acts of August 4, 1790 (1 Stat. 169), and of March 2, 1799 (1 Stat. 675), and as so enacted was in force until January 1, 1865.

A basic change in admeasurement method was provided in the act of May 6, 1864, effective January 1, 1865 (13 Stat. 70–72, R. S. 4153, 46 U. S. C. 77). The method described in the act of May 6, 1864, appears to have been substantially the same as that in force in 1945.

For the transition period, 1865–1868, the total tonnage figures for the fleet are "mixed." During those years, the total fleet tonnage was obtained by combining the "old admeasurement" tonnage of vessels not yet readmeasured and the "new admeasurement" tonnage of vessels which had been readmeasured or newly built. For a recapitulation of the "old" and "new" *components* of the fleet tonnage (not the same vessels) for each year, 1865–1868, see *Commerce and Navigation, 1870*, p. 798.

No table has been located comparing the tonnage of a substantial number of vessels under "new" and "old" admeasurement; hence, neither the magnitude nor the direction of the change can be stated here. Apparently it varied for different types of vessels. "Brigs, schooners, and sloops measure less under the 'new' admeasurement . . . while ships, barks, steamboats, and vessels having closed-in spaces above their hulls have their tonnage largely increased." Further, the difference between "old" and "new" was not believed to affect a comparison of New England shipbuilding for the years 1855 and 1868. (See *Treasury Annual Report*, 1868, p. 496.)

Another type of change in maritime law affecting the statistics is illustrated by the act of April 18, 1874 (18 Stat. 31), which exempted the greater amount of canalboat and other unrigged tonnage from documentation. (See U.S. Code, title 46, sec. 336.) For 1874–1876, the "balance sheets of tonnage," published annually in the source volumes, record the removal of 879,000 tons of vessels for this reason alone. However, *Merchant Marine Statistics, 1936*, lists 843,000 tons exempted in 1876, whereas the 1876 balance sheet of tonnage specified 601,000 tons exempted. The reason for this discrepancy is not clear. The tonnage exempted annually, 1874–1936, is shown on pp. 54–55 of *Merchant Marine Statistics, 1936*.

At irregular intervals, steps were taken to remove from the tonnage accounts those vessels lost, abandoned, captured, sold to aliens, etc., which had not been officially reported for removal purposes. From the outset, the failure to remove such vessels annually resulted in a cumulative error which inflated the statistics of tonnage. When general clearances of this cumulative error were made, the effect was concentrated in a single year or a small group of years.

For a basic statement on this subject, see *American State Papers*, cited above, vol. 1, p. 494, where Albert Gallatin, Secretary of the Treasury, outlines the problem and discusses the first attempt (1800) to deal with it. Recurrently, in the annual tonnage reports found in the source volumes, the problem is discussed, the announcement is made that the rolls have been finally cleared, and assurance is given that the problem has been solved for the future. However, as late as 1867, in spite of repeated clearances in earlier years, the "First Annual Report of the Director of the Bureau of Statistics" stated, "The tonnage returns were swelled with thousands of ghostly ships—ships that had gone to the bottom years ago." (See *Annual Report of the Secretary of Treasury, 1867*, p. 244.)

In 1869, the Register of the Treasury attributed the entire decline of tonnage reported for 1869 to this factor. (See *Treasury Report, 1869*, p. 300.) In the same year, Francis A. Walker, Deputy Special Commissioner of Revenue in Charge of the Bureau of Statistics, stated that the process of assigning a number to each vessel and the institution of an annual list of vessels, as required by the Act of July 28, 1866, "has succeeded in clearing from the lists of vessels . . . a vast amount of purely fictitious tonnage, which have been carried forward from year to year although thousands of vessels which this tonnage originally represented had been meanwhile lost at sea, broken up, or sold abroad." (See *Treasury Report, 1869*, p. 342.)

In the "balance sheets of tonnage" published annually in the source volumes, clearances of cumulative error are generally identified as "not heretofore credited" to distinguish them from listings of removals of the various types routinely reported as having occurred during the given year.

Some of the more important clearances of this cumulative error, and the tons of shipping thereby removed, were: 1800–1901, 197,000; 1811, amount not stated but the effect is evident in series Q 418; 1818, 182,000; 1829–1830, 604,000; 1837, 96,000; 1841–1842, 267,000; and 1855–1858, 945,000.

In later years, the terms "obsolete," "obsolete, not heretofore reported," and "correction of balance" found in annual balance sheets of tonnage, frequently reflect removal of cumulative errors. Examples are (in tons): 1864, 188,000; 1866, 1,063,000; 1867, 260,000; 1868, 128,000; 1869, 338,000; 1870, 58,000; 1871, 103,000; 1881, 157,000.

Other factors which require that early merchant-vessel statistics should be used with some caution are the following: (1) In some instances, systematic differences in identically described statistical series appear in the source volumes (see text for series Q 433–437) which reflect conflicting series of figures, possibly originating from different primary sources of data (see table II below); (2) transcription and typographical errors have crept into historical tables in the source volumes in the process of repeated recopying and retypesetting; (3) statistically significant footnotes which appeared in early reports frequently were dropped in later years; and (4) caution is suggested in referring back to the earlier volumes in the search for explanations of discrepancies or major changes, since the earlier data may reflect the same or similar errors.

In this volume (see table II below), a number of the copying and typesetting errors have been corrected where the exact nature of the discrepancy could be determined beyond reasonable doubt; several broad differences in figures have been pointed out; and a few detailed tabular notes have been added based on information in various annual issues selected largely at random.

[5] As shown in table 16, p. 28, of source.

Q 414–416. Employment on U.S. flag merchant vessels—basic wage scale for able-bodied seamen, 1929–1970.

Source: U.S. Maritime Administration, *Seafaring Wage Rates*, and unpublished data.

Seamen on both coasts receive extra pay for Saturdays and Sundays at sea. Beginning November 1955, West Coast incorporated this extra pay into base wages but East Coast did not. Monthly wage rate represents basic wage, over and above subsistence (board and room), paid to seamen having qualifying experience and employed on U.S. flag merchant vessels.

See also general note for series Q 414–505.

Q 417–432. Documented merchant vessels, by major classes, material of which built, and trade, 1789–1970.

Source: U.S. Bureau of Marine Inspection and Navigation, *Merchant Marine Statistics, 1936* and *1965* (annual report now published by the U.S. Coast Guard), and U.S. Bureau of Customs, unpublished data. (**Series Q 427–428,** 1884, U.S. Department of the Treasury, *Annual Report of Commission of Navigation, 1884*, p. 161.)

See also general notes for series Q 413–564 and Q 414–505.

For 1789–1793, tonnage figures are the "duty tonnage," i.e., the tonnage of vessels on which duties were collected during the year. (See *American State Papers*, cited above in general note for series Q 414–505, vol. 1, p. 895.) The "duty tonnage" appears to have been the tonnage on which duties were collected on registered vessels, including "the repeated voyages of the same vessel," plus tonnage of the enrolled and licensed vessels which paid tonnage duties once each year. (See *American State Papers*, vol. 1, pp. 494, 498, 528.) Beginning in 1794, "district tonnage returns" were used, derived from reports of District Collectors of Customs, which gave the tonnage of vessels in each district based on registers, enrollments, and licenses outstanding, as of December 31.

For 1794–1801, figures are district tonnage returns, with no attempt to correct for the cumulative error caused by failure to remove vessels lost, abandoned, sold to aliens, etc. (See *American State Papers*, vol. 1, pp. 494, 499.) The figures for 1800–1801 ignore the first clearing of tonnage accounts which took place during these years. (See *American State Papers*, vol. 1, pp. 494–499, 527–531.) The correction for the cumulative error for *registered vessels only* would reduce the 1800 total to 819,571 tons and the 1801 total to 903,235 tons. The sharp drop attributable to the clearing of tonnage accounts would thereby be shifted back to 1800 instead of appearing in 1802.

For 1802–1818, the figures in series Q 418 consist of the "corrected registered" tonnage plus the uncorrected enrolled or licensed tonnage (see 1813 tonnage report in *American State Papers*, vol. 1, p. 1017). The figures for 1811 and 1818 reflect two additional attempts to clear out the cumulative error of registered vessels improperly retained on the registers. (See *American State Papers*, vol. 1, pp. 876, 958, and vol. 2, p. 406.)

The figures shown below in table III are those which were derived by a method authorized by Secretary of the Treasury Gallatin. They were reported to Congress in the annual tonnage reports in *American State Papers* as being the "actual" or "more nearly correct" tonnage.

Table III. "Actual Tonnage" of Documented Vessels: 1800 to 1818

[In thousands of gross tons]

Year	Tons	Year	Tons
1818	1,150	1808	1,173
1817	1,341	1807	1,208
1816	1,264	1806	1,166
1815	1,262	1805	1,085
1814	1,029	1804	983
1813	1,032	1803	917
1812	1,127	1802	865
1811	1,131	1801	850
1810	1,329	1800	768
1809	1,266		

These were obtained by taking the "corrected registered tonnage" and adding to it the "duty tonnage" for enrolled and licensed vessels. Since duties were paid only once each year on enrolled and licensed vessels, and owners were not likely to pay duties on nonexistent vessels, it was reasoned that the lower "duty tonnage" figure more accurately reflected the true total for the enrolled or licensed craft than did the district returns of tonnage based on outstanding marine documents. This correction for enrolled and licensed craft was dropped after 1818, probably because, beginning 1819, the "duty tonnage" for this group exceeded the district tonnage returns for the group.

In *American State Papers*, vol. 1, p. 499, the tonnage described as "actual tonnage" in the comparative table for 1794–1799 is, in fact, the district returns of tonnage without correction of any kind. Elsewhere in the tonnage report for 1800 (pp. 494–499), and in tonnage

reports for later years, the term "actual tonnage" normally means the district returns based on outstanding marine documents (registers, enrollments, and licenses) corrected for cumulative error. In table III, the term "actual tonnage" is used in the latter sense; the figures are from annual tonnage reports, 1800–1818, in *American State Papers*, vols. 1 and 2.

Q 427–428, vessels, by material of which built. The source publication also classifies tonnage of each material by type of propulsion (steam, motor, sail, canalboat, and barge).

Q 429–432, vessels, by trade in which engaged. The source publication also presents the number of vessels engaged in each type of trade as well as tonnage. The statutes do not recognize for documenting purposes any fisheries except the cod, mackerel, and whale. Vessels engaged in catching any other fish, such as salmon or menhaden, are documented for the mackerel fishery.

Figures in early reports identified as "registered," or as "registered in foreign trade," commonly include the registered vessels engaged in the whale fishery. Accordingly, figures on "whale fishery" found in early reports should be examined carefully to determine whether they represent the entire whaling fleet or only the "enrolled or licensed" portion. The term "fisheries" as used in early volumes refers to cod and, later, to cod and mackerel fisheries. It rarely includes the whale fishery.

In terms of documentation as "registered," "enrolled," "licensed," series Q 429–432 are composed broadly as follows:

Series Q 429 (foreign trade) represents the total "registered" minus "registered whale fishery." The "registered" whaling tonnage is, however, included for 1794–1798.

Series Q 430 (coastwise and internal) represents the portion of the enrolled or licensed group engaged in this trade. The rest of the enrolled or licensed group is in series Q 432 (cod and mackerel fisheries).

Series Q 431 (whale fishery) is the "registered whale fishery" portion of the registered fleet plus the "whale fishery" portion of the enrolled or licensed fleet. For 1794–1798, however, the registered whaling tonnage is not included here, but in series Q 429.

Series Q 432 (cod and mackerel fishery) is the cod and mackerel fishery portion of the enrolled or licensed fleet. The rest of the enrolled or licensed group is in series Q 430 (coastwise and internal).

Q 433–437. Merchant vessels built and documented, by type, 1797–1964.

Source: See source for series Q 417–432.

The source publication also presents statistics separately for steam, motor, and sailing vessels, canalboats, and barges. Statistics for motor vessels begin in 1893.

Beginning 1938, figures are not comparable with those for earlier years and are probably understated. They represent those vessels built during the 12-month period which were still existent and documented as part of the merchant fleet at the end of the period. Hence, they exclude vessels completed during the period which were lost, sold to U.S. Government, sold to aliens, or otherwise removed from merchant vessel documentation before the end of the period.

Q 486a. Documented merchant vessels, western rivers (Haites), 1811–1868.

Source E. F. Haites, J. Mak, and G. M. Walton, *Western River Transportation During the Era of Early Internal Improvements, 1810–1860*, Johns Hopkins University Press, 1975, Appendix B (copyright).

This series was calculated by the authors from W. M. Lytle, *Merchant Steam Vessels of the United States 1807–1868*, Mystic, Conn., The Steamship Historical Society of America, 1952, and *Supplements* 2 (1954) and 3 (1958), edited by F. R. Holdcamper.

The Lytle List is an alphabetical listing of steamboats based on the original records for documented merchant vessels constructed in the United States between 1807 and 1868. The entry for each steamboat includes its gross measured tonnage (by the pre-1865 calculation), year of construction, port of construction, and year of termination of service. Steamboats operating on the western rivers during this era were of a special design. Steamboats not built on the western rivers were not well suited to operate there; steamboats built to operate there generally did not leave the river system. The western river steamboats were, therefore, isolated on the basis of their port of construction. The number and tonnage of the western river steamboats starting and terminating service each year was then calculated and these series were combined to give the tonnage in operation at the end of the calendar year.

Series Q 486a differs from series Q 486 primarily in the treatment of the steamboats that ceased operation. Figures for series Q 486a exclude steamboats in the year during which they ceased to operate. Figures for series Q 486 exclude such steamboats only at irregular intervals.

See also general notes for series Q 413–564 and Q 414–505.

Q 487–502. U.S. flag merchant vessels, steam and motor, 1934–1970.

Source: U.S. Maritime Administration, *Employment Report of United States Flag Merchant Fleet Oceangoing Vessels 1,000 Gross Tons and Over*, annual issues.

See general notes for series Q 413–564 and Q 414–505.

Q 503–505. Documented merchant vessels, by type of service, 1934–1970.

Source: See source for series Q 417–432.

Series Q 505 includes cable, cod, dredging, elevator, ferry, fireboat, fishing, ice breaker, lightering, oil exploitation, oystering, passenger, pile driving, pilot boat, police boat, patrol boat, refrigerator, towing, waterboat, whaling, welding, wrecking, and miscellaneous. The source presents details for each of these in recent years.

See also general notes for series Q 413–564 and Q 414–505.

Q 506–517. General note.

Net tonnage capacity, as used here, refers to net or registered tonnage of the vessel, not weight of cargo. The net tonnage is what remains after deducting from the gross tonnage (defined in general note for series Q 414–505) the spaces occupied by the propelling machinery, fuel, crew quarters, master's cabin, and navigation spaces. It represents, substantially, space available for cargo and passengers. It is the usual basis for tonnage taxes and port charges. The net tonnage capacity of a ship recorded as "entered with cargo" may bear little relation to actual weight of cargo. Gross tonnage and net tonnage are both measures of cubic capacity, not of weight, 100 cubic feet equaling 1 ton. These terms should not be confused with the cargo ton of 2,000 pounds. Tonnage figures shown in series Q 507 and Q 513 for U.S. vessels entered and cleared, respectively, in foreign trade are greater than the total tonnage of U.S. vessels documented for the foreign trade because the "entered" and "cleared" series include tonnage for each vessel as often as it "enters" or "clears" each year. The documented tonnage, series Q 418, includes the tonnage of each vessel once for each year.

These figures include the tonnage of all types of watercraft engaged in the foreign trade, whether entering or clearing with cargo or in ballast, which are required to make formal entrance and clearance under U.S. customs regulations. Vessels engaged in trade on the Great Lakes with Canada as well as in trade with Mexico are also included. Vessels touching at a U.S. port in distress or for other temporary causes without discharging cargo, and Army and Navy vessels carrying no commercial cargo, are not required by customs regulations to enter or clear and thus are not included in the figures.

Vessels are reported as entered at the first port in the United States at which entry is made, regardless of whether any cargo is unladen at that port; arrivals at subsequent ports are not counted. Vessels are reported as cleared from the last port in the United States where loading of outward cargo is completed or where the vessel cleared in ballast; departures from prior ports are not counted.

Q 506–508. Vessels entered, all ports, 1789–1970.

Q 518–523. Value of waterborne imports and exports (including re-exports) of merchandise, 1790–1970.

Source: 1790–1820, see source for series Q 506–508; 1821–1858, U.S. Bureau of Marine Inspection and Navigation, *Merchant Marine Statistics, 1936*, p. 91; 1859–1935, *Statistical Abstract of the United States*, 1859–1866, *1895* edition, pp. 399–400; 1867–1912, *1913* edition, pp. 318–319; 1913–1923, *1924* edition, p. 417; 1924–1935, *1946* edition, p. 552. (See general note for series Q 413–564 for the various agencies which have issued the *Statistical Abstract.*) U.S. Bureau of the Census, 1943–1946, *Foreign Commerce and Navigation of the United States*, annual issues, 1947–1950, *Waterborne Trade by United States Port*, FT 972, annual issues, 1951–1970, *Waterborne Foreign Trade Statistics*, FT 985, annual issues (title changed to *U.S. Waterborne Foreign Trade* in July 1965).

The primary source of figures for 1790–1820 is J. R. Soley, "The Maritime Industries of America," *The United States of America* (N. S. Shaler, Editor), vol. II, 1894, pp. 522–527, 534, 536, 538. The report gives the percent of imports and exports in U.S. vessels. Guetter and McKinley (cited above for series Q 506–508) have derived absolute figures by applying these percentages to total imports and exports of merchandise and specie. The primary source of figures for 1821–1935 is *Foreign Commerce and Navigation of the United States*, annual issues. Starting with 1943, import or export statistics by method of transportation, showing shipping weight as well as dollar value, have been compiled by the Bureau of the Census.

See also general note for series U 187–352.

Q 524–529. Tonnage of waterborne imports and exports, by flag of carrier vessel, 1921–1970.

Source: U.S. Bureau of the Census, 1921–1945, *Foreign Commerce and Navigation of the United States*, annual issues; 1946–1957, releases and unpublished data; 1958–1970, *Statistical Abstract of the United States*, various issues.

Excludes cargoes (small in the aggregate) carried by ships of less than 100 tons gross capacity prior to 1946. Beginning 1946, excludes Army and Navy cargo, and includes Alaska, Hawaii, and Puerto Rico. Beginning July 1950, excludes commodities classified for security reasons as "special category." From July 1953 to December 1955 and July 1956 through December 1962, exports exclude shipments under $500 in value regardless of shipping weight; for January–

June 1956, exports exclude shipments under $1,000. For 1963 and later years, exports exclude shipments to Canada individually valued under $2,000 and to other countries under $500. Under $100 shipments are excluded for all years. Beginning 1954, imports exclude shipments under 2,000 pounds shipping weight regardless of value, as well as shipments valued at less than $100 regardless of shipping weight. For January 1960 through June 1965, imports exclude formal entry shipments valued at less than $100 and informal entry shipments valued under $251. For July–December 1965 and later years, imports exclude all shipments under $251.

Q 530–541. Waterborne cargo tonnage, foreign and domestic, 1924–1970.

Source: U.S. Corps of Engineers, 1924–1946, *Annual Report of the Chief of Engineers*, part 2; 1947–1970, *Waterborne Commerce of the United States*, 1971, part 5, *National Summaries*, pp. 5 and 6.

In 1954, part 2 of the *Annual Report* was superseded by a separate publication entitled *Waterborne Commerce of the United States* (published in several regional parts). Part 5 of this report, *National Summaries*, presents separate figures for series Q 534–535 for "Canadian" and "overseas."

Cargo tonnage refers to the weight of cargo and should not be confused with gross tonnage shown in series Q 417–505 or the net or registered tonnage capacity shown in series Q 506–517, which are measures of cubic capacity, not of weight. See also text for those series.

Domestic commerce includes all commercial movements between points in the United States, Puerto Rico, and the U.S. Virgin Islands. Traffic with the Canal Zone is treated as foreign commerce.

Foreign commerce includes all movements between the United States and foreign countries, and between Puerto Rico and the U.S. Virgin Islands (considered a single unit) and foreign countries. Trade between U.S. outlying areas (Guam, Wake, American Samoa, etc.) and foreign countries is excluded.

"Coastwise" commerce, series Q 537, refers to domestic traffic receiving a carriage over the ocean, or the Gulf of Mexico; and to traffic between Great Lakes ports and seacoast ports, when having a carriage over the ocean.

"Lakewise" commerce, series Q 538, refers to traffic between U.S. ports on the Great Lakes System.

"Local and intraport" commerce, series Q 539, refers to movements of freight within the confines of a port whether the port has only one or several arms or channels, except car-ferry and general ferry. The term is also applied to marine products, sand, and gravel taken directly from the Great Lakes.

"Internal" commerce, series Q 540, covers traffic between ports or landings where the entire movement takes place on inland waterways; movements involving carriage on both inland waterways and waters of the Great Lakes; inland movements that cross short stretches of open waters which link inland systems; marine products, sand, and gravel taken directly from beds of the oceans, the Gulf of Mexico, and important arms thereof; and movements between offshore installations and inland waterways.

"Intraterritory" commerce, series Q 541, refers to traffic between ports in Puerto Rico and the U.S. Virgin Islands, which are considered as a single unit.

Q 542–547. Waterborne bulk freight traffic on the Great Lakes, 1900–1970.

Source: Lake Carriers' Association, *Annual Report, 1970*, pp. 51–52 and 76–77 (copyright).

Includes tonnage moving to or from Canadian or U.S. lake ports, in Canadian or U.S. bulk carriers.

Q 548–552. Freight traffic on the Sault Ste. Marie canals, 1855–1900.

Source: U.S. Corps of Engineers, *Statistical Report of Lake Commerce Passing Through Canals at Sault Ste. Marie*, 1931.

These series include traffic moving through the American and Canadian canals. Figures for later years may be obtained from various issues of Corps of Engineers, *Annual Report*, part 2, *Commercial Statistics*. They are not shown here because they pertain only to traffic between Lake Superior and the other lakes; series Q 542–547, therefore, provide more comprehensive totals of Great Lakes traffic.

Q 553–555. Commercial ocean traffic on the Panama Canal, 1915–1970.

Source: 1915–1924, Governor of the Panama Canal, *Annual Report, 1948*, p. 10; 1925–1970, Panama Canal Company, *Annual Report*, various issues (copyright).

Does not include U.S. Government traffic.

Q 556–557. Tonnage moved on New York State canals, 1837–1970.

Source: State of New York, Department of Public Works, *Annual Report of the Superintendent*, annual issues, and unpublished data.

Q 558. Federal expenditures for rivers and harbors, 1822–1970.

Source: 1822–1882, *Statement of Appropriations and Expenditures for Public Buildings, Rivers and Harbors, Forts, Arsenals, Armories, and Other Public Works from March 4, 1789 to June 30, 1882*, U.S. Senate Ex. Doc., vol. 7, No. 196, 47th Congress, 1st session (Treasury Department Doc. No. 373), pp. 521–522; 1883–1919, Federal Works Agency, records (compiled from Treasury Department accounts); 1920–1970, U.S. Corps of Engineers, *Annual Report of the Chief of Engineers on Civil Works Activities*, vol. I, annual issues.

Figures include expenditures for rivers, harbors, and flood control prior to 1928. In 1928, expenditures for flood control amounted to less than $13,500,000. Figures for 1929–1970 exclude expenditures for flood control. The figures include amounts expended from emergency relief and Public Works Administration funds, 1933–1937, but exclude $5,500,000 for purchase of Cape Cod Canal, 1928, expended by and accounted for by the Treasury Department.

Q 559–564. Investment in canals, by region and agency of enterprise, 1815–1860.

Source: H. Jerome Cranmer, "Canal Investment, 1815–1860," *Studies in Income and Wealth*, vol. 24, National Bureau of Economic Research, New York, 1960, pp. 555 and 556. (Copyright, Princeton University Press.)

The development of data on annual canal investment was based on an averaging process applied to the experience of a sample of 24 canals for which annual expenditure figures were available. For a list of those canals and description of the estimating operations, see source.

Adjusted estimates of annual expenditures were made for every canal or canal system undertaken between 1815 and 1860. Expenditures for river and harbor improvements were not included, nor for slack water navigation except when the expenditures were part of a canal project. The estimates were then aggregated by region and by agency of enterprise within each region. The regional estimates were then aggregated to provide estimates of annual investment in canals for the entire United States, together with estimates for State and private enterprise.

The Northeast consists of the New England and Middle Atlantic States, including Maryland and the District of Columbia. The South encompasses the area south of the Potomac and Ohio Rivers; and the West, the region north of the Ohio River, except that the Louisville and Portland canal which, though actually located in Kentucky, south of the Ohio River, is included in the West region.

Series Q 413. Persons Entering the United States by Ship: 1933 to 1970

[In thousands. For years ending June 30. Covers persons disembarking, as reported on U.S. Customs Service forms, and differs from series C 315]

Year	Persons entering	Year	Persons entering	Year	Persons entering	Year	Persons entering

[1] Estimates of personnel employed on U.S. merchant ships, 1,000 gross tons and over. Excludes vessels on inland waterways, Great Lakes, and those owned by, or operated for, the U.S. Army and Navy, and special types such as cable ships, tugs, etc.

[2] Decrease due to seafaring strike.

[3] Average monthly employment.

[4] Seamen on both coasts receive extra pay for Saturdays and Sundays at sea. Beginning 1955, West Coast incorporated this extra pay into base wages but East Coast did not.

Series Q 417–432. Documented Merchant Vessels, by Major Classes, Material of Which Built, and Trade: 1789 to 1970

[Gross tonnage of documented vessels of 5 tons or more. As of December 31, 1789–1834; September 30, 1835–1842; June 30, 1843–1940; January 1 thereafter]

Year	Number of vessels	Gross tonnage (1,000)

NA Not available.
Z Less than 500 tons.
[1] For 1920–1937, tonnage for vessels with electric screw included in total (series Q 420 or Q 423) but excluded from series Q 421, Q 422, and Q 424. Maximum such tonnage included in series Q 420 is 201,246 in 1933 and maximum in series Q 423 is 91,470 in 1934.
[2] Includes gasoline engines, not shown separately.
[3] Includes canalboats and barges prior to 1868.
[4] Includes iron, steel, composite, concrete, bronze, and aluminum.
[5] Beginning 1937, excludes mackerel.
[6] Increase due to documentation of 1 large vessel on Atlantic Coast.
[7] Figures for 1789 are for ships paying tonnage duties during the last 5 months of the year. Figures for 1790–1792 are for ships paying duties at some time during the year.

Series Q 433–437. Merchant Vessels Built and Documented, by Type: 1797 to 1964

[Gross tonnage of documented vessels of 5 tons or more. As of December 31, 1797–1834; September 30, 1835–1842; June 30, 1843–1940; January 1 thereafter. Includes Alaska, Hawaii, Puerto Rico, Guam, and the Virgin Islands]

– Represents zero. NA Not available.

[1] Includes canalboats and barges prior to 1868.

[2] Jan. 1–Dec. 31.

[3] July 1, 1939–June 30, 1940.

[4] 9-month period.

[5] Figures by class of vessel do not add to the total for this year.

Series Q 438–448. Merchant Vessels Completed by U.S. Shipyards: 1914 to 1970

[Tons in thousands. Represents self-propelled steel vessels of 2,000 gross tons and over for domestic use. Excludes Alaska and Hawaii]

[1] Excludes U.S. Army and Navy cargo and Great Lakes.

Series Q 530–541. Waterborne Cargo Tonnage, Foreign and Domestic: 1924 to 1970

[In thousands of short tons of 2,000 pounds. For definition of cargo tonnage, see text. Net totals are derived by deducting two types of duplications from unadjusted totals: (1) Traffic between seaports and river points, and (2) "Other duplications," comprising principally coastwise and lake traffic passing through canals and connecting channels other than the St. Marys Falls Canal and the Detroit River]

[1] Figures for 1924–1945 are approximations; there are some minor duplications in figures for foreign traffic. Domestic commerce, for 1924–1946, includes "rivers, canals, and connecting channels," not shown separately.

[2] Includes figures for harbor traffic of New York, Philadelphia, and San Francisco; local traffic of other seaports, and local traffic of lake ports.

[3] Beginning 1959, excludes traffic in Alaska and Hawaii; such traffic included in other domestic traffic categories.

Chapter Q

Air Transportation (Series Q 565-637)

Q 565–637. General note.

Only scattered data on air transportation are available for years before 1926. Regular collection of national statistics began with the establishment in that year of an Aeronautics Branch in the Department of Commerce. In 1934 a Bureau of Air Commerce was organized in that department. The Civil Aeronautics Act of 1938 created the Civil Aeronautics Authority, an independent regulatory agency, which was reorganized in 1940 into 2 separate entities, the Civil Aeronautics Board and the Civil Aeronautics Administration. In 1958, the latter's functions were transferred to the Federal Aviation Agency, which in turn was made a part of the Department of Transportation in 1966 and renamed the Federal Aviation Administration (FAA). The FAA's annual *Statistical Handbook of Civil Aviation* is the source for the statistics presented here.

Federal promotion and regulation of civil aviation are carried out by the Civil Aeronautics Board and the Federal Aviation Administration. The Board issues certificates permitting persons to engage in air transportation as a business, fixes air mail rates which they may charge, and may establish maximum and minimum rates for transportation of passengers and goods. The responsibility for investigation of aviation accidents, formerly held by the Civil Aeronautics Board, now (1975) resides with the National Transportation Safety Board of the Department of Transportation.

The principal activities of the Federal Aviation Administration are: Controlling the use of navigable airspace; prescribing regulations dealing with the competence of airmen, airworthiness of aircraft, and aircraft control; operation of air route traffic control centers, airport traffic control towers, and flight service stations; the design, construction, maintenance, and inspection of navigation, traffic control, and communications equipment for the airways; and promotion of air safety.

These agencies publish annual operational data on the use of airway facilities; data related to the location of airmen, aircraft, and airports; the activity volume in the field of non-air carrier (general aviation) flying; and aircraft production and registration.

Statistics of domestic scheduled airline operations cover trunk airlines, local service airlines, helicopter carriers, and territorial airlines except those operating in Alaska. Scheduled intrastate airlines are not included anywhere, nor are those operating locally in Alaska. Statistics of international scheduled airline operations include not only operations to and from foreign countries but overseas operations to American possessions. They also include the service of Northwest Airlines and Pan American World Airways between the United States and Alaska. Some companies operate in both the domestic and the international fields, but the statistics are segregated.

Operations of scheduled carriers of cargo only are generally not included.

Q 565–576. Aircraft production and exports, 1913–1970.

Source: U.S. Federal Aviation Administration, *FAA Statistical Handbook of Aviation*, various annual issues (including, in some cases, subsequent revisions).

There is no aircraft production in Alaska or Hawaii.

Q 577–590. Scheduled air transportation, domestic and international, 1926–1970.

Source: See source for series Q 565–576.

The term *certificated route air carrier* refers to air carriers holding certificates of public convenience and necessity, issued by the Civil Aeronautics Board, authorizing the performance of scheduled air transportation over specified routes and a limited amount of nonscheduled operations. Certificated route air carriers are often referred to as "scheduled airlines," although they also perform nonscheduled service. *Nonscheduled service* comprises revenue flights that are not operated in regular scheduled service, such as charter flights, and all nonrevenue flights incident to such flights. *Scheduled service* is transport service operated over an air carrier's certificated routes, based on published flight schedules, including extra sections and related nonrevenue flights.

For series Q 579, the figures are for "route mileage operated" from the beginning of the series through 1961. Thereafter, they represent the total route miles for passenger/cargo and all-cargo carriers, reported separately in the source.

Series Q 589, average available seats, was derived by dividing passenger seat-miles by revenue miles flown in passenger service.

Q 591–603. Scheduled airline revenues and expenses, 1938–1970.

Source: See source for series Q 565–576.

Q 604–623. Airports, aircraft, pilots, and miles flown, 1926–1970.

Source: See source for series Q 565–576.

Figures for airports and landing fields, series Q 604–605, include civil, military, and FAA (formerly CAA) fields but exclude seaplane facilities prior to 1953. Growth of airports after 1940 was stimulated by Federal defense expenditures during World War II and by the Federal-aid airport program thereafter.

Estimates of the number of certificated pilots, series Q 607–610, refer to persons certificated by FAA in the various classifications. Some may not have been actively engaged in the classification for which they were certificated. The count of certificated pilots after 1941 is not directly comparable with the previous years as the Civil Aeronautics Regulations were amended to permit pilot certificates currently effective on April 1, 1942, to continue in effect indefinitely. This amendment expired on July 1, 1947. The number of commercial pilots, series Q 609, rose sharply after 1944 because the CAA awarded many veterans commercial certificates on the basis of their military flying experience. The number of private pilots, series Q 610, increased sharply after 1939 because of the federally subsidized civilian pilot training program which was initiated in 1939. It gave preliminary training to hundreds of thousands of men who went into the military service. Miles flown, series Q 614–618, includes business flying (by corporate executives or employees or by individuals, including farmers, on personal business), commercial flying (contract, charter, crop-dusting, photographic, etc.), instructional flying, pleasure flying, and other flying (testing, experimental, ferrying, Civil Air Patrol, etc.). Separate data on these five categories are given in the source.

Q 624–637. Air transportation accidents, 1927–1970.

Source: 1927–1962, see source for series Q 565–576; 1963–1970, U.S. Civil Aeronautics Board, *Handbook of Airline Statistics, 1971*.

An aircraft accident is considered to be any occurrence, while the aircraft is operating as such, which results in fatal or serious injury

to persons or appreciable damage to the aircraft. The aircraft is considered to be "operating as such" from the time the engine is started for purposes of flight until the flight is completed; in the case of gliders, while they are under tow or gliding.

Propeller accidents to persons are included. A collision between two or more aircraft is counted as one accident.

Data include military contract operations for 1956–1970 but not for earlier years. Scheduled cargo carriers are included for 1949–1970, but not for earlier years.

Series Q 565–576. Aircraft Production and Exports: 1913 to 1970

– Represents zero. NA Not available.

[1] Value of aircraft, engines, parts, parachutes, etc. For 1959–1970, represents net sales value of "complete aircraft and parts" plus "aircraft engines and parts."

[2] 1913–1918, fiscal years; 1919–1957, calendar years. Data for the second half of 1918 are included with calendar year 1919.

[3] Exclusive of gliders and barrage balloons. 1949–1954, civil aircraft only.

[4] Total value of aircraft, engines, parts, etc. Prior to 1922, engine values were not reported separately but were probably included with either "other" internal combustion engines or with "parts" of aircraft. Values for parachutes and their parts have been included only since 1932.

[5] Comparable data not available.

[6] Values are for military aircraft produced in the United States only. These data were computed by the War Production Board in terms of August 1943 unit cost. The values are not meant to measure output at current prices or expenditures. The 1940 figure is only for the second half of that year; the 1945 figure covers only the first 8 months.

[7] Represents domestic civil only; data on new aircraft produced for export not available.

Series Q 577–590. Scheduled Air Transportation, Domestic and International: 1926 to 1970

[As of December 31 or for years ending December 31. All data reflect scheduled operations exclusively. Domestic data include intra-Alaska carriers beginning 1941 for series Q 586 and Q 587; 1948 for series Q 580 and Q 585; 1949 for series Q 582; and 1961 for series Q 581]

Year	Number of operators	Aircraft in service [1]	Route mileage in operation	Average passenger-revenue per passenger-mile	Persons employed	Revenue miles flown (1,000)	Revenue passengers carried		Revenue passenger-miles flown (millions)	Ton-miles flown		Fuel consumed, gasoline (mil. gal.)	Average available seats	Average speed (m.p.h.)
							Duplicated [2] (1,000)	Unduplicated [3] (1,000)		Express and freight (1,000)	Mail (1,000)

NA Not available.
[1] Figures for 1961–1970 for domestic airlines are for total aircraft in service, domestic and international.
[2] Duplication exists where (a) the same passengers were carried on more than 1 route of an air carrier; and (b) where the same passengers were carried by more than 1 air carrier.
[3] Duplication has been eliminated where the same passengers were carried on more than 1 route of an air carrier, but still exists where the same passengers were carried by more than 1 air carrier.
[4] Computed by CAA from reports of duplicated revenue passengers.
[5] Excludes Marine Airlines.
[6] Excludes Colonial and Marine Airlines.
[7] Includes nonrevenue passenger-miles flown.
[8] Includes nonrevenue passengers.
[9] Excludes Colonial Airlines, Inc., and Hawaiian Airlines, Ltd.
[10] Excludes 224,236 ton-miles flown by U.S. Army.
[11] Excludes Colonial Airlines, Inc.
[12] Includes employees of Pan American Airways.
[13] Included with domestic air transportation.

* Denotes first year for which figures include Intra-Alaskan and Intra-Hawaiian carriers.

[1] Minus sign denotes loss.

[2] Items of aircraft operating expense are not comparable with prior years and include items of ground and indirect expenses as follows: (a) direct maintenance flight equipment (series Q600) also includes direct maintenance ground equipment, and indirect maintenance; (b) depreciation flight equipment (series Q 601) also includes other depreciation and amortization expenses; (c) ground and indirect expense (series Q 602) includes only those expenses chargeable to general services and administration.

[3] Operating expenses for 1956 are not directly comparable with those for subsequent years because of the revision in the *Uniform System of Accounts and Reports* put into effect on January 1, 1957. The time period covered and the number of air carriers involved precluded a full conversion to the new reporting system, and only limited adjustments in data for 1956 were made by CAB.

[4] Sum of the items does not agree with total due to rounding procedure.

[5] Includes total operating expenses for Colonial Airlines, Inc., for which distribution by type of expense was not available.

[6] Excludes Colonial Airlines, Inc.

[7] Excludes Midet Aviation Corporation due to inadequacies in reporting.

Series Q 604–623. Airports, Aircraft, Pilots, and Miles Flown: 1926 to 1970

[As of December 31 or for years ending December 31, except as noted. Includes Alaska, Hawaii, and outlying areas for all years]

NA Not available.

[1] Includes seaplane bases, heliports, and, beginning 1954, military fields having joint civil-military use. Prior to 1954, all military fields are included.

[2] 1946–1962 includes gliders. Beginning 1950, active and inactive aircraft.

[3] Beginning 1963, data are for active certified airplane pilots only. Also beginning 1963, total includes student, helicopter, glider, and other pilots, not shown separately.

[4] As of Mar. 1, 1954.

[5] As of May 1, 1949.

[6] As of Apr. 1, 1948.

[7] Airline transport rating became effective May 5, 1932.

[8] Corporation and individual business transportation, not for hire.

[9] Passenger and cargo transportation for hire, aerial application (crop dusting, spraying, seeding, etc.), patrol, survey, and other miscellaneous work use.

[10] Comprises express and freight ton-miles.

[11] Includes some military ton-miles and may include a small amount of international traffic.

[12] Civil and military.

[13] Estimated from information received on Aircraft Use and Inspection Reports.

[14] No survey was conducted. Data for 1958–61 have been revised using a correction factor based on the 1962 survey of aircraft use in general aviation. Data for 1963 are based on hours and use reported on aircraft inspection reports adjusted by the same correction factor.

[15] The 1962 general aviation survey excluded gliders, dirigibles, and balloons. These data have been adjusted to include them.

– Represents zero. X Not applicable. Z Less than 1/10 of a person.

[1] Includes scheduled revenue operators only.

[2] Rates computed on basis of total passengers carried and passenger-miles flown, revenue and nonrevenue. Applies to passenger-carrying service only. Excludes passenger deaths occurring in dynamite/sabotage accidents; July 25, 1957, 1 passenger; Jan. 6, 1960, 29 passengers; May 22, 1962, 37 passengers; May 7, 1964, 41 passengers.

[3] Represents aircraft revenue-miles per fatal accident.

[4] Midair collision, nonfatal to air-carrier occupants.

[5] Includes 2 midair collisions nonfatal to air-carrier occupants.

[6] Excludes sabotage disaster at Longmont, Colo., on Nov. 1, 1955 in which 5 crew members and 39 passengers were fatally injured.

[7] Includes 1 ground collision between 2 air-carrier aircraft, 1 in scheduled passenger service and 1 in other revenue operations.

Chapter R

Communications

Telephone and Telegraph Systems (Series R 1-92)

R 1–92. General note.

Among the primary sources of governmental historical statistics relating to the telephone and telegraph industries are the following:

1. U.S. Bureau of the Census. *Compendium of the Seventh Census of the United States, 1850; Compendium of the Tenth Census of the United States, 1880; Statistics of Manufactures, 1890,* Census Bulletin No. 196, June 1892.

2. U.S. Bureau of the Census. Quinquennial censuses of the telephone and telegraph industry, 1902–1937: Bulletin No. 17, *Special Reports: Telephones and Telegraphs, 1902; Special Reports: Telephones, 1907;* Bulletin No. 102, *Telegraph Systems: 1907; Telephones and Telegraphs and Municipal Electric Fire-Alarm and Police-Patrol Signaling Systems, 1912; Census of Electrical Industries: 1917, Telegraphs and Municipal Electric Fire-Alarm and Police-Patrol Signaling Systems; Census of Electrical Industries: Telephones—1917, 1922, and 1927; Census of Electrical Industries: Telegraphs—1917, 1922, and 1927; Census of Electrical Industries: Telephones and Telegraphs, 1932 and 1937.* (Multiple year titles represent different volumes for each year.)

3. U.S. Interstate Commerce Commission. Reports of telephone and telegraph carriers, 1914–1933:

a. *Memorandum Concerning Telephone Companies and Telegraph Companies Reporting to the Interstate Commerce Commission for the Years 1916 and 1917* (processed).

b. *Annual Report on Telephone Companies,* 1920–1927, 1928–1932, and 1933 (processed); *Annual Report on Telegraph Companies,* 1926–1927, 1928–1932, and 1933 (processed).

4. U.S. Congress. *Report on Communication Companies* (Splawn Report), issued as House Report No. 1273, 73d Cong., 2d sess. (1934) in connection with the consideration of the Communications Act of 1934. This report contains detailed data from the carrier reports filed with the Interstate Commerce Commission and also the results of a questionnaire to the telephone, telegraph, and radio industries for 1922–1932.

5. U.S. Federal Communications Commission. Reports of telephone and telegraph companies filed monthly and annually with that agency, 1934–1970. Selected data from these reports have been issued either monthly or quarterly, and annually (in processed form), in the Commission's annual reports to Congress and beginning 1939, in the FCC's annual *Statistics of the Communications Industry in the United States.*

6. U.S. Federal Communications Commission, *Investigation of the Telephone Industry in the United States,* House Document No. 340, 76th Cong., 1st sess. (1939). This report includes the results of the Commission's investigation of the American Telephone and Telegraph Company (AT&T). Page 609 of the report refers to a number of staff reports, or exhibits, containing more detailed statistical and other material prepared in connection with the investigation and issued in processed form. These staff exhibits and reports are listed under the title, *Special Investigation Docket No. 1.*

7. Statistics for 1926–1934 obtained by the Federal Communications Commission from telephone and telegraph companies and designed to afford the FCC a basis for determining whether carrier rates were just and reasonable and in enforcement of other statutory responsibilities. (The text of the telephone inquiry appears in "Telephone Division Order No. 9," FCC, *Reports,* vol. 1, p. 49; the text of the telegraph inquiry is in "Telegraph Division Order No. 12," FCC, *Reports,* vol. 1, p. 88. Responses are available to the public at the Commission.)

Other major sources of telephone and telegraph statistics are the annual reports to stockholders by AT&T (Bell), the Western Union Telegraph Company, and statistics of independent (i.e., non-Bell) telephone companies compiled and published by the United States Independent Telephone Association.

A major factor affecting the statistics of the telephone and telegraph carriers has been the prescription of uniform systems of accounts for these companies by the Interstate Commerce Commission and by the Federal Communications Commission after its formation in 1934. The ICC prescribed a uniform system of accounts for telephone companies having annual operating revenues exceeding $50,000, effective January 1, 1913, and for telegraph carriers, effective January 1, 1914. The ICC issued more detailed accounting systems, effective January 1, 1933, for Class A companies, and condensed classifications for Class B companies, effective January 1, 1934. The FCC adopted a revised uniform system of accounts for Class A and Class B telephone companies, effective January 1, 1937. The outstanding change was a requirement that telephone plant be recorded in the accounts at original cost, i.e., cost at time of first dedication to public use. The FCC adopted a revised uniform system of accounts for Class C telephone companies, effective January 1, 1939 (the earlier ICC system had been established, effective January 1, 1915). The FCC differentiates among Class A, B, and C companies on the basis of operating revenues, which have had varying limits over the years.

The reporting authority of the FCC relates only to telephone and telegraph carriers engaged in interstate and foreign communication which cross State or national boundary lines over their own facilities or through connection with facilities of an affiliated carrier having such facilities. Thus, carriers filing reports with the FCC (with the exception of a small number of companies filing voluntarily) exclude a large number of small, and a few large, telephone companies.

R 1–45. General note.

The Bell System provides the great bulk of local exchange and interexchange or toll telephone facilities and service in the United States. It includes the parent company of the Bell operating telephone companies, consolidated with "associated holding and operating companies in the United States, not including connected independent or sublicensee companies." The figures as presented are "statements of the Bell Telephone business as a whole, eliminating all duplications and showing the figures and results as 'if operated by a single company.'" The parent company has been American Telephone and Telegraph Company since January 1, 1900; prior to that date it was the American Bell Telephone Company. The number of companies included within the Bell group has varied from time to time. In 1914, approximately 35 companies were included and in 1915–1916 the number increased to 39. Subsequent consolidations reduced the number to 29 in 1920 and to 25, including Cincinnati Bell, Inc., and Southern New England Telephone Company in 1970. Since 1936, however, AT&T in its consolidated financial statements has excluded these 2 large noncontrolled companies. For comparability with previous years, however, the figures have been adjusted to include

these 2 companies using reports filed by them with the FCC. "Bell companies" and "Bell System" are at times used interchangeably herein. Unless otherwise specified, the reference is to "Bell System."

Included in the Bell organization in 1970 were the following:

1. AT&T, which is the parent company.
2. 21 regional subsidiaries owned and controlled by AT&T, plus a subsidiary of one of these regional companies. These 22 Bell System principal telephone subsidiaries furnish exchange and intrastate toll service, as well as interstate toll telephone service; they constitute, with the parent, the Bell System of 1970.
3. Two other major companies, Cincinnati Bell, Inc. and Southern New England Telephone Company, in which AT&T has substantial minority interests. These 2 companies, together with the 22 above, are referred to as the Associated Companies.
4. Bell Telephone Laboratories, Inc., a scientific research and development organization, and Western Electric Company, Inc., which is the Bell manufacturing and supply organization.

In addition, a number of Bell Company affiliates have varying degrees of stock interest in various other telephone companies. Data for series R 1–30 relating to the Bell companies exclude operations of Bell Telephone Laboratories and of Western Electric, except as their operations affect operating expenses and miscellaneous income of the Bell companies. Bell Telephone Laboratories operates on a nonprofit basis and the profits of Western Electric on sales to the Bell companies are not eliminated in the consolidated statements.

The historical growth of the Western Electric Company is described in the FCC *Report . . . on the Investigation of the Telephone Industry . . .*, pp. 56–64. More recent data appear in the "Report on Preliminary Survey and Investigation of Western Electric Company, Inc.," prepared by a committee of National Association of Railroad and Utilities Commissioners and FCC representatives (July 15, 1948, processed), and in annual supplements since 1948. In 1970, AT&T's annual share of the net income of Western Electric was over $253 million.

Independent companies are referred to as non-Bell companies, although AT&T or Bell companies have financial interests in some of them. The independents participate with Bell in providing toll service, and have contractual arrangements with AT&T and the Bell Associated companies.

R 1 and R 3–8. Total telephones, Bell System telephones, and telephones of independent companies, 1876–1970.

Source: U.S. Federal Communications Commission, unpublished data; American Telephone and Telegraph Company, unpublished data; and the following U.S. Bureau of the Census reports: *Telephones and Telegraphs, 1902*, table 2, for total telephones in 1880, 1890; table 4, for total telephones in 1902; table 6, for Bell System telephones in 1902; *Telephones, 1907*, table 51, for total telephones in 1907; table 54, for Bell System telephones; *Telephones and Telegraphs . . . , 1912*, table 1, for total telephones and Bell System telephones in 1912; p. 37 for telephones connecting with the Bell System; *Telephones and Telegraphs, 1932*, table A for total telephones in 1917, 1922, 1927, and 1932; table 12, for Bell System telephones in 1922, 1927, and 1932; *Telephones and Telegraphs, 1937*, table 1, for total telephones and Bell System telephones in 1937.

The data for 1876–1934 (except census data) were taken from FCC records consisting of *Special Investigation Docket No. 1*, "Report on Control of Telephone Communications," vol. III, Exhibit 2096-D, p. 11 (June 15, 1937, processed), and "Report on American Telephone and Telegraph Company Corporate and Financial History," vol. I, Exhibit 1360-A, pp. 115 and 150. The data for 1935–1956 were supplied to FCC by AT&T; substantially the same data are also available in the AT&T annual reports to stockholders. The data for 1957–1970 were supplied by AT&T, compiled from annual reports and unpublished data.

The number of telephones comprises the total number of instruments and extensions in the system. Telephones also include telegraph and teletypewriter stations through 1930 and private line telephones through 1934, but not thereafter. Lines, basically for internal use, on which outside calls to public phones cannot be placed constitute private line telephones.

The households with telephones are based on census figures, utilized by AT&T in conjunction with the number of telephones in residences.

R 2. Telephones per 1,000 population, 1876–1970.

Source: 1876–1956, U.S. Federal Communications Commission, unpublished data (except for census data). For census data and 1957–1970, see source for series R 1 and R 3–8.

Annual figures are based on data supplied to FCC by AT&T.

R 9–12. Average daily conversations, 1880–1970.

Source: U.S. Federal Communications Commission, unpublished data. Figures are based on data supplied to FCC by AT&T.

Generally, exchange service is telephone service within an exchange area. A local call is defined as a call originating in and completed within the same public exchange area; a toll call is one which originates in one exchange destined to another exchange area, whether located nearby or across the continent. In instances in which there is a high community of interest between exchanges, accompanied by considerable calling on a message toll basis, "extended area service" has been established under which adjacent and nearby exchanges are included in the subscriber's local service area. The growth of this type of service each year has significantly affected the number of calls classified as local, which otherwise would have been classified and charged as toll. Moreover, elimination of toll charges through the establishment of extended area service has tended to stimulate telephone usage within the service area.

Conversations are those completed calls originating from company and service telephones, excluding private line telephones. Local calls include both completed and uncompleted calls. Bell System toll messages consist of interstate and intrastate completed calls originated or terminated at Bell System Associated Company telephones, and toll messages originated or terminated at connecting (i.e., independent) company telephones, provided their transmission utilized toll line facilities of a Bell operating company. Toll messages handled wholly over facilities of connecting or nonconnecting independent companies are shown under Independent Companies. Toll message figures include ship-to-shore messages and international messages. Since a toll ticket is made for each toll call, the count can be relatively exact. In very large exchanges, some counts of local calls are automatically accumulated in message registers but in small exchanges the counts are estimates based upon samples.

R 13–16. Telephone toll rates between New York City and selected cities, 1902–1970.

Source: 1902, U.S. Bureau of the Census, *Special Reports: Telephones and Telegraphs, 1902*, p. 77; 1911–1970, U.S. Federal Communications Commission, unpublished data.

Data for 1911–1917 are based on records of AT&T, newspapers, and other published reports. Data for 1919–1937 are based on information in FCC, Telephone Rate and Research Department, "The Classified Toll Rate Structure and Basic Rate Practices for Message Toll Telephone Service," pp. 40–47 (Jan. 15, 1938, processed). Data for 1940–1970 are based on unpublished data and tariffs of the FCC. Considerable historical toll rate data also appear in the report of a committee of National Association of Railroad and Utilities Commissioners (NARUC) and FCC representatives, *Message Toll Telephone Rates and Disparities*, annual October issues.

The three major classes of toll telephone messages are dial station-to-station, operator station-to-station, and person-to-person. Dial station-to-station service denotes that service where the person originating the call from other than a coin telephone station dials

the telephone number desired and the call is completed without the assistance of a telephone company operator.

In interstate toll service, operator station rates are over 10 percent higher than dial station rates, and person-to-person rates are over twice the amount of the rates for dial station service. On station calls, the starting point is computed at the time communication is established between the calling and called stations; on person-to-person calls, the chargeable period begins when the person called is reached. There was generally no rate differentiation between station and person service until January 21, 1919.

A paucity of historical data exists with respect to local exchange rates. Such data can only be laboriously constructed from the records of the Bell System companies and other telephone companies or from the tariffs filed with each State which has regulatory authority over the intrastate telephone rates. One source of data pertaining to exchange rates is the Bureau of Census report, *Telephones and Telegraphs and Municipal Electric Fire-Alarm and Police-Patrol Signaling Systems, 1912*, pp. 49–156, which presents telephone rates of selected cities in 38 States and the District of Columbia. Another source of exchange rate data is provided by the responses of telephone companies to FCC, "Telephone Division Order No. 9," which called for rates in effect in selected size exchanges between 1907 and 1933. These responses are on file at the FCC.

R 17–18. Telephone plant, book value and depreciation reserves, 1880–1970.

Source: 1885–1935, U.S. Federal Communications Commission, unpublished data consisting of *Special Investigation, Docket No. 1* "Report on American Telephone and Telegraph Company Corporate and Financial History," vol. I, Exhibit No. 1360-A (Jan. 16, 1937, processed), pp. 73, 102; vol. II, Exhibit No. 1360-B, Schedule 2 (appendix); "Report on Associated Bell Telephone Companies Financial and Operating Data," Exhibit No. 1364 (Jan. 23, 1937), Schedule A-15; 1936–1956, American Telephone and Telegraph Company, annual reports, and FCC, unpublished data; 1957–1970, AT&T, annual reports and unpublished data.

Census data are from the following U.S. Bureau of the Census volumes: *Compendium of the Tenth Census, 1880*, p. 1332; *Telephones and Telegraphs, 1902*, table 6, p. 7; *Telephones and Telegraphs . . . , 1912*, table 29; *Telephones, 1917*, table 33; *Telephones, 1922*, table 34; *Telephones and Telegraphs, 1932*, table 17, and *1937*, table 1 (see general note for series R 1–92 for complete list of census sources).

The FCC's uniform system of accounts, which became effective January 1, 1937, requires establishment of telephone plant accounts on the basis of original cost (cost at time of first dedication to the public use). This applies to all plants ordinarily having a service life of more than one year as well as franchises, patents, rights of way, leaseholds, and other interests in land.

The depreciation policies of the Bell System have undergone various changes from a simple maintenance reserve set up for the purpose of equalizing maintenance charges over a period of years and providing for deferred maintenance expenses, to depreciation rates prescribed by the FCC. Prescription of depreciation rates for Bell companies began in 1949 and initial prescriptions were completed in 1953. For a discussion of Bell System depreciation policies, see *Report of the Federal Communications Commission on the Investigation of the Telephone Industry in the United States*, pp. 325–349.

R 19. Miles of wire, 1880–1970.

Source: 1880–1884, American Telephone and Telegraph Company, unpublished financial report; 1885–1935, U.S. Federal Communications Commission, unpublished data consisting of *Special Investigation Docket No. 1*, Exhibit No. 1360-A, pp. 76, 115; 1936–1956, AT&T, annual reports, and FCC, unpublished data; 1957–1970, see source for series R 17–18.

Census data are from the following U.S. Bureau of the Census volumes: *Compendium of the Tenth Census, 1880*, p. 1327; *Telephones and Telegraphs, 1902*, table 2; *Telephones, 1922*, table 21; *Telephones and Telegraphs, 1937*, table 14.

Miles of wire are not an adequate index of the growth in telephone capacity for a variety of reasons: The shift from single open wire lines to complex cable systems including coaxial tubes; use of carrier systems to increase significantly the number of communication channels over a band of frequencies transmitted over an electrical circuit; and use of microwave radio systems not included in the statistics of wire lines.

R 20–22 and R 27–28. Operating revenues, net income, and dividends, 1880–1970.

Source: 1881–1914, U.S. Federal Communications Commission, unpublished data consisting of *Special Investigation Docket No. 1*, Exhibit No. 1360-A, pp. 39, 54, 73, 81, 89, 109 (for operating revenues and division between local and toll revenues, 1900–1914, Schedule B-2 of *Special Investigation Docket No. 1*, Exhibit No. 1364 combined with Long Lines revenues from p. 395 of Exhibit 1360-B); 1915–1956, American Telephone and Telegraph Company, annual reports, and FCC, unpublished data; 1957–1970, see source for series R 17–18.

Census data are from the following U.S. Bureau of the Census reports (see general note for series R 1–92 for detailed listing of sources): *Compendium of the Tenth Census, 1880*, p. 1329; *Statistics of Manufactures, 1890*, pp. 1, 5; *Telephones, 1907*, table 36; *Telephones and Telegraphs . . . , 1912*, table 29; *Telephones, 1917*, tables 21, 30, and 31; *Telephones, 1922*, tables 2, 31, 32; *Telephones, 1927*, table 1; *Telephones and Telegraphs, 1932*, table 1, and *1937*, table 1.

Figures for series R 20–22 for 1900–1914 have been adjusted by the FCC by subtracting uncollectible operating revenues so that they are comparable with figures for 1915–1970.

Operating revenues include monthly service charges; amounts charged for connection, restoration and termination of service, and for moves, instrument changes, and similar service requirements; initial nonrecurring charges for plant or equipment, except initial charges based on the cost of specially assembled private branch exchanges; and amounts of service charges for supplemental or auxiliary equipment as extension stations and auxiliary receivers. Operating revenues include the telegraph services of the Bell System, including revenues derived from teletypewriter exchange service (TWX), and private line service; international radiotelephone service; directory advertising and sales; and rent revenues.

Net income is net operating income and other income, including dividend income and interest income, including interest charged to construction; minus miscellaneous deductions from income and fixed charges (as interest deductions). All of the Bell System operations are included; however, as noted below (see text for series R 25), prior to 1933 only the dividends from controlled companies not consolidated were included.

Dividends declared refer to the entire Bell System operations, excluding dividends paid by one system company to another.

R 23. Operating expenses, 1880–1970.

Source: 1885–1907, U.S. Federal Communications Commission, unpublished data consisting of *Special Investigation Docket No. 1*, Exhibit 1360-A, pp. 54, 73, 109 (figures for operating expenses derived by subtracting net earnings from revenues); 1908–1935, American Telephone and Telegraph Company, annual reports; 1936–1956, AT&T, annual reports, and FCC, unpublished data; 1957–1970, see source for series R 17–18. For census data, see source for series R 20–22 and R 27–28.

For 1885–1907, FCC's figures include all taxes (including Federal income taxes) and interest expense and miscellaneous income. For 1908–1913, figures also include Federal income taxes. For 1914–1920, figures were adjusted to exclude estimated amounts of Federal income taxes by use of annual reports of the individual Bell Telephone

companies to the Interstate Commerce Commission. For 1921–1935, the Federal income tax adjustment was obtained from AT&T unpublished data.

Figures include that portion of the expenses of Bell Telephone Laboratories absorbed by AT&T.

R 24. Federal income taxes, 1914–1970.

Source: 1914–1920, U.S. Federal Communications Commission, unpublished data (approximations derived from annual reports of individual Bell System companies to the ICC); 1921–1935, American Telephone and Telegraph Company, unpublished data; 1936–1956, AT&T, annual reports, and FCC, unpublished data; 1957–1970, see source for series R 17–18.

R 25. Other income, net, 1882–1970.

Source: 1882–1956, American Telephone and Telegraph Company, annual reports, and U.S. Federal Communications Commission, unpublished data; 1957–1970, see source for series R 17–18.

Since 1933, instead of including under this item only the dividends from controlled companies not consolidated, the AT&T has included its proportionate interest in the total earnings or deficits of such companies.

R 26. Interest expenses, 1885–1970.

Source: 1885–1956, American Telephone and Telegraph Company, annual reports, and U.S. Federal Communications Commission, unpublished data; 1957–1970, see source for series R 17–18. Census data are from the following U.S. Bureau of the Census reports: *Special Reports, Telephones, 1907*, table 57; *Census of Electrical Industries: 1917, Telephones*, table 30; *Census of Electrical Industries: Telephones, 1922*, table 31.

Interest expense includes interest on all classes of debt owing to the public but excludes intercompany interest payment.

R 29–30. Employees and wages, 1880–1970.

Source: **Series R 29**, 1885–1899 and 1907–1935, U.S. Federal Communications Commission, unpublished data consisting of *Special Investigation Docket No. 1*, Exhibit No. 1360-A, pp. 76, 136, 147; **series R 29–30**, 1900–1906, and **series R 30**, 1913–1935, American Telephone and Telegraph Company, unpublished data; **series R 29–30**, 1936–1956, AT&T, annual reports to stockholders, and FCC, unpublished data; 1957–1970, see source for series R 17–18.

Census data are from the following U.S. Bureau of the Census reports (see general note for series R 1–92 for detailed description of sources): *Compendium of the Tenth Census, 1880*, p. 1327; *Statistics of Manufactures, 1890*, p. 1; *Telephones and Telegraphs, 1902*, tables 2, 6; *Telephones and Telegraphs . . . , 1912*, tables 3, 29; *Telephones, 1917*, table 1; *Telephones, 1922*, table 1; *Telephones 1927*, table 1; *Telephones and Telegraphs, 1932*, table 1; *Telephones and Telegraphs, 1937*, table 1.

Employee figures for 1885–1935 exclude Western Electric Company.

Figures for 1939–1956 also appear in the FCC annual issues of *Statistics of the Communications Industry in the United States*. These issues also contain detailed reports of the occupational classifications and wage rates of Bell System employees.

R 31–45. Independent telephone companies—property, revenues, expenses, interest, net income, dividends, employees, and wages, 1916–1970.

Source: U.S. Federal Communications Commission, 1916–1934, unpublished data. United States Independent Telephone Association (USITA), 1935–1962, *Annual Statistical Volume of the United States Independent Telephone Association*, various issues (copyright); 1963–1970, *Independent Telephone Statistics*, annual issues (copyright).

Census data are from the following U.S. Bureau of the Census reports (see general note for series R 1–92 for detailed description of sources): *Telephones, 1917*, tables 1, 30, 31, 33; *Telephones, 1922*, tables 1, 22, 32; *Census of Electrical Industries: Telephones, 1927*, tables 1, 34; *Telephones and Telegraphs, 1932*, table 1, and *1937*, table 1.

The large discrepancy between the census figures and the Federal Communications Commission and USITA figures is due to the major differences in coverage. The following excerpt from Bureau of the Census, *Telephones, 1922*, refers to census coverage:

> Unit of enumeration ("system" or "line").—So far as practicable, a report was secured for each system or line operated under separate ownership. The terms "system" and "line" are sometimes used synonymously but, in general, the former is employed with reference to the aggregations of lines operated by the larger companies while the latter is more commonly used to denote the small farmer or rural lines. A farmer or rural line may be merely an individual line connected with an exchange under different ownership, or may be a party line without an exchange or connected with an exchange owned jointly with other lines or under independent ownership.

Figures for 1916–1933 were based on ICC annual summaries (which did not differentiate between the Bell System and the independent telephone companies) and were derived by subtraction from the ICC figures of those amounts for each company included on a consolidated basis in the data shown for series R 17–30.

Figures for 1935–1970 were obtained by USITA from reports of independent telephone companies to the USITA. For recent years, the publications provide detailed data on companies reporting to the USITA, and limited data in respect to companies not reporting to the USITA. Certain totals for combined reporting and nonreporting independent companies are shown for 1961–1970 in the USITA *1971 Annual Statistical Volume.*

A discussion of the relations between the Bell System and the Independents is presented in the FCC *Report . . . on the Investigation of the Telephone Industry . . .*, pp. 123–146; and a Report of Committee of National Association of Railroad and Utilities Commissioners and FCC representatives, *Message Toll Telephone Rates and Disparities.*

R 46–74. General note.

Since the 1850's, the Western Union Telegraph Company has been the dominant carrier in the domestic telegraph industry. Established in 1851 as the New York & Mississippi Valley Printing Telegraph Company, this company succeeded by 1866 in acquiring or merging dozens of competing telegraph companies and emerging as the sole telegraph company in the United States. (See Robert Luther Thompson, *Wiring a Continent; the History of the Telegraph Industry in the United States, 1832–1866*, Princeton University Press, 1947.) In succeeding decades, smaller telegraph companies were formed, serving a region or major cities, often with the intent of forcing Western Union to acquire them. Western Union developed close contractual ties with the railways. Telegraph pole lines were constructed along railroad rights-of-way. The lines were used jointly for general telegraph and railroad telegraph communication and signaling; and railroad stations and personnel were used for the pick-up and delivery of telegraph messages.

Western Union's most serious telegraph rival, Postal Telegraph, was acquired by the Mackay interests in the 1880's as the domestic pick-up and delivery agent for Mackay's Commercial Cable Company (later the International Telephone and Telegraph Company). Until the 1920's, Postal Telegraph competed with Western Union for the larger and more profitable routes. Beginning in the 1920's, Postal Telegraph attempted to provide a nationwide service in full competition with Western Union. Postal Telegraph expanded its own facilities and also made arrangements with the telephone com-

panies, gasoline stations, and others for the pick-up and delivery of telegrams.

The expansion of Postal Telegraph coincided roughly with the emergence of more effective competition from other sources. Predominantly, such competition came from the growth and development of toll telephone service, the expansion of domestic airmail, the introduction of the Bell System's teletypewriter exchange service (TWX), which was sold to Western Union in 1971, and the provision of domestic radiotelegraph service by the international radiotelegraph carriers, RCA Global Communications and the Mackay Companies. (In 1942, as a war measure, domestic radiotelegraph service was discontinued and was not subsequently resumed.) Postal Telegraph's share of domestic telegraph revenues was less than 25 percent. In 1943, Postal Telegraph merged with Western Union. (See U.S. Federal Communications Commission, *Reports*, vol. 10, pp. 148–198, September 27, 1943, for Commission approval of the specific terms of the merger.)

R 46–55. Western Union Telegraph Company—summary of facilities, traffic, and finances, 1866–1915.

Source: **Series R 46–49** (except 1913), The Western Union Telegraph Company, annual reports; 1913, Moody's Investors Service, *Moody's Public Utilities Reports*, 1919, New York (copyright). **Series R 50–55** (except R 52, 1914–1915), U.S. Interstate Commerce Commission, Bureau of Valuation, *Accounting Reports, The Western Union Telegraph Company* (December 31, 1915 and June 30, 1919); **series R 52**, 1914 and 1915, U.S. Federal Communications Commission, unpublished data. Census data are from the following U.S. Bureau of the Census reports: 1880, *Compendium of the Tenth Census, 1880*, pp. 1310–1325; *Special Reports: Telephones and Telegraphs, 1902*, tables 39, 41; *Telegraph Systems: 1907*, tables 1–8; *Telephones and Telegraphs . . . , 1912*, tables 2, 3.

The data for series R 52, 1914 and 1915, are based on ICC Bureau of Valuation report cited above, Exhibit V, sheets 2 and 3.

According to the *Compendium of the Seventh Census*, 1854, p. 189, there were 89 telegraph lines having 23,261 miles of wire in 1853. In 1854, the miles of wire were estimated at over 30,000.

The 1880 census data include many companies in addition to Western Union, and the later census data include Postal Telegraph as well as reports from some 15 to 20 small companies. Included in the Postal Telegraph data were the telephone operations of that company. The 1902 census data include the several domestic ocean-cable systems, while the 1880, 1907, and 1912 census figures exclude ocean-cable systems other than the Western Union Cable Division.

Other statistics appear in 60th Cong., 2d sess., *Investigation of Western Union and Postal Telegraph-Cable Companies*, U.S. Senate Document No. 725 (1909); State of New York, *Proceedings of Joint Committee Investigation of Telephone and Telegraph Companies* (1910); and *Submarine and Land Telegraph Systems of the World*, an excerpt from the Treasury Department, *Monthly Summary of Commerce and Finance*, January 1899.

R 56–70. Domestic telegraph industry—messages, property, revenues, expenses, net income, dividends, employees, and wages, 1916–1970.

Source: 1916–1928, U.S. Interstate Commerce Commission and U.S. Federal Communications Commission, unpublished data (annual reports of Western Union Telegraph Company and Postal Telegraph-Cable Company to the ICC); 1929–1955, FCC, *Statistics of the Communications Industry in the United States*, 1955, pp. 110–115; 1956–1970, FCC, *Statistics of Communications Common Carriers*, annual issues, and unpublished data (data are from the annual reports of Western Union Telegraph Company to the FCC). Census data are from the following U.S. Bureau of the Census reports (see general note for series R 1–92 for detailed identification of sources): *Census of Electrical Industries: 1917, Telegraphs . . .*, tables 1, 2, 4, 5; *Telegraphs, 1922*, tables 2, 3, 5, 6; *Telegraphs, 1927*, tables 2, 3, 5, 6; *Telegraphs, 1932*, tables 2, 3, 4; *Telephones and Telegraphs, 1937*, tables 2, 3, 4.

For 1916–1928, the Western Union reported landline (domestic) and cable operations on a merged basis; therefore, supplementary material was obtained from Western Union relating to the landline operations. Necessarily, these involve estimates and allocations, the precise bases of which were not specified. For 1929–1955, figures were obtained from annual reports of the telegraph carriers to the ICC and to the FCC, supplemented by correspondence and reference to the reports of the telegraph companies.

Each census report, 1917–1937, included Western Union Cable Division with Western Union telegraph plant. Similarly, the census reports of 1917, 1922, and 1927, in reporting Western Union operating revenues, operating expenses, net income, and dividends declared, include Western Union cables. Apparently, in each census report, number of employees and wages and salaries were for Western Union landline system only.

The census data refer to approximately 15 to 20 minor domestic telegraph companies, in addition to Western Union and Postal Telegraph. In 1943, Western Union acquired Postal Telegraph, and the telegraph company data, beginning in 1944, relate to the single merged carrier.

R 56, messages handled. Prior to 1935, the annual count of revenue messages handled was based on a count of messages during the month of January and was partly estimated. For 1935–1950, most of the Western Union message data were based on an actual count for 2 days in each month at some 400 of the largest offices which together accounted for about 80 percent of total message revenues. The Postal Telegraph data continued to be based on counts and estimates for the month of January projected to annual totals. For 1950–1970, Western Union used a scientifically constructed random message sample, the results of which provide generally reliable monthly and annual message data by service classes and rate zones.

Data include telegraph traffic with Canada and Mexico. Such traffic forms only a small portion of the message data.

R 57, private-line telegraph service revenues of telegraph companies. For 1916–1935, data were furnished to FCC by Western Union and added to annual report figures for Postal Telegraph; for 1936–1943, figures are from annual reports of Western Union and Postal Telegraph.

Private line, or leased circuit, revenues are derived from the lease of wires, cables, channels, circuits, and similar wire-telegraph facilities to banks, airlines, governmental agencies, and other large organizations for the exclusive use of these customers. The charge for such service is based on contractual rent agreements providing for definite periodic terms without regard to the extent of the service obtained by the users of such facilities.

R 58, private-line telegraph service revenues of telephone companies. Data for 1916–1938 apply to the Bell System telephone companies only. Data for 1916–1926 and 1935–1938 were obtained from unpublished data of the Bell System. Data for 1927–1934 were obtained from the Bell System response to the FCC, "Telegraph Division Order No. 12," and appear in "Some Aspects of Competition Affecting the Land Wire Telegraph Industry" (1937), an unpublished FCC staff study. For 1939–1970, data include all telephone companies reporting on an annual basis to the FCC (roughly varying between 60 and 125).

R 59–60, telegraph plant. Effective January 1, 1914, the ICC prescribed a Uniform System of Accounts for telegraph and cable companies and required the carriers to keep their accounts in conformity with this system. All charges made to plant and equipment or other property accounts with respect to any property acquired on or after January 1, 1914, were to be the actual money costs of the property. The ICC did not attempt to prescribe the depreciation rates of the carriers.

In 1940, the FCC adopted a revised uniform system of accounts for wire telegraph and ocean cable carriers, to go into effect January 1, 1942. The effective date was later postponed to January 1, 1943. The new system was designed to supplant the previous system in use since 1914. The FCC prescribed depreciation rates for the telegraph carrier, effective January 1, 1948. After the merger of Western Union and Postal Telegraph, the Commission required that the merged carrier reclassify its plant as of January 1, 1943.

Telegraph plant book costs for 1946–1970 were affected by two conflicting factors: Accelerated retirement of old plant, and addition of new plant as part of the general modernization program of the Western Union Telegraph Company begun in 1946. As part of its modernization program the Western Union Telegraph Company leased substantial plant, in the form of voice channels, from the Bell System.

Census figures on book cost of plant include Western Union cables in all years.

R 61, miles of wire. Wire figures are not a satisfactory measure of the capacity of the domestic telegraph industry for various reasons, including the shift from less efficient open wire to more efficient cable; the introduction of multiplex terminal equipment, which has permitted a significant subdivision of each telegraph channel and the simultaneous transmission of messages on each such subdivision; the leasing from the Bell System telephone companies of voice-frequency channels and the subdivision of these channels into a substantially greater number of telegraph channels; operation by Western Union of its microwave radio system for the transmission of messages; and use of modernized routing and switching systems.

R 62–68, finances, employees, and wages and salaries. Operating revenues are derived, in the bulk, from various transmission and nontransmission telegraph services. However, a small proportion has been derived from incidental services, such as errand service, time service, and code registration. The operations of the former Postal Telegraph toll telephone system were included until February 1, 1952, when Western Union disposed of this service. Also included in operating revenues are revenues derived by the domestic telegraph carrers in handling the domestic haul of insular, mobile, and foreign cable and radiotelegraph communications. Such domestic haul is between the "gateway" cities and the interior of the nation.

To obtain data on total operating expenses, the domestic telegraph carriers (Western Union and Postal Telegraph) were required to subdivide their expense accounts as between domestic and international operations in respect to compensation, overhead, materials and supplies, and other charges. Such allocations are subject to some arbitrariness.

Census data for 1917, 1922, and 1927 with respect to operating revenues, expenses, and net income differ from the other data as a result of the inclusion of Western Union cable operations and the inclusion of minor companies, in addition to Western Union and Postal Telegraph.

No adjustments were made in the annual reported income statements. Thus, the net loss shown for 1945 resulted from a substantial retroactive wage award made by the War Labor Board. This was shown in the 1945 statement of the Western Union Telegraph Company as an extraordinary charge (less recoverable income taxes).

Income taxes (through 1963, when the cables were sold) are total Western Union income taxes minus those assigned by the company itself to its cable operations. The amounts assigned to Western Union cables were obtained by the FCC from Western Union on an informal basis. Income taxes for 1924 and prior years are not available separately and are included in total operating expenses.

Dividends declared (through 1963, when the international operations were sold), include the entire operations of Western Union, domestic and international. No basis exists for allocating them.

Number of employees was reported as of different periods: 1929–1934, at the end of June; 1935–1945, at the end of December; and 1946–1970, at the end of October. However, wages and salaries are uniformly reported for the calendar year ending December 31.

R 69–70, Bell Teletypewriter Exchange (TWX) Service. For 1931–1934, data are from responses to FCC, "Telegraph Division Order No. 12"; for 1935–1938, from the FCC *Annual Report.*

Teletypewriter exchange service (TWX) was initiated November 21, 1931. The revenues from this service, as well as the private line telegraph revenues of telephone companies, are not included in total operating revenues, which is limited to the revenues of domestic telegraph carriers. The TWX service of the telephone industry was purchased by Western Union in 1971.

R 71–74. Domestic telegraph message rates and TWX rates between New York City and selected cities, 1850–1970.

Source: U.S. Federal Communications Commission, unpublished data.

The 1850 rates are cited in William Holmes, *History of Telegraph Rates, 1860 to 1913* (an unpublished study obtained by the FCC from the Western Union Telegraph Company), p. 2. The same source states, p. 8, that the New York-Chicago rate from 1866 to October 1, 1869, was $1.85, although James D. Reid, *The Telegraph in America* (1886), p. 746, states that the Chicago rate was $2.05 between 1866 and 1869, and U.S. Senate, 60th Cong., 2d sess., *Investigation of Western Union and Postal Telegraph Cable Companies*, Document No. 725 (1909), p. 24, claims that in 1866 this rate was $2.20. Holmes, p. 8, is the source for the 1866 and 1869 New York-Philadelphia rates. Reid, p. 746, quotes the New York-San Francisco rates for 1866 and 1869. The *Investigation of Western Union . . .*, p. 24, is also the source for the New York-Denver rate as of 1866. The 1870 rates are mentioned in 51st Cong., 1st sess., *Hearings before the House Committee on the Post-Office and Post-Roads on Postal Telegraph Facilities*, p. 131. In addition, Holmes, p. 9, states that in 1870 the maximum rate from States north of Washington, D.C., to San Francisco was reduced from $7.45 in currency (or $6.75 if paid in gold) to $5.00 in currency (or $4.00 in gold). The 1873 rates are shown in *Investigation of Western Union . . .*, p. 24. Holmes, p. 10, states that the $2.50 San Francisco rate became effective February 1, 1873, and a reason given was that $2.50 was the denomination of a coin in common use on the Pacific Coast. The same source, p. 12, describes the New York-Chicago rate in 1875 as having been 25 cents and in 1877 as being successively increased to 40 cents, 50 cents, and 60 cents. Holmes also states, p. 11, that the New York-Denver rate became $2.00 in March 1876 and that the San Francisco rate was reduced to $2.00 in August 1876. However, Reid mentions, p. 747, March 1877 as the date $2.00 was fixed as the maximum rate between New York City and points east of the Rocky Mountains. The 1883 rates are also from *Investigation of Western Union . . .*, p. 24. Holmes, p. 17, states that the $1.00 San Francisco rate became effective in March 1884 as part of a general reduction which established $1.00 as the maximum rate for a 10-word full rate telegram between any two points in the Western Union system. Holmes also reports, p. 17, that in June 1884 the rate between New York and Chicago charged by Western Union was 50 cents, by Postal Telegraph, 25 cents, and by the Baltimore and Ohio Telegraph Company, 40 cents. The 1888 rates are based on State of New York, *Report of the Joint Committee of the Senate and Assembly of the State of New York Appointed to Investigate Telephone and Telegraph Companies* (transmitted to the Legislature March 21, 1910), p. 687, and the annual report of Western Union to stockholders for 1888, p. 5. The 1890 rates are from *Hearings Before the House Committee on the Post-Office and Post-Roads on Postal Telegraph Facilities*, p. 68. The rates in effect as of 1908 are from *Investigation of Western Union . . .*, p. 24, although there is evidence from other sources that some of these rates were put into effect in 1907. The 1919 rates were the result of a 20 percent increase in domestic telegraph rates as set forth in the 1919 Western Union annual report to stockholders, p. 8.

The 1931 TWX rates are from testimony on behalf of AT&T by Mr. Carroll O. Bickelhaupt in the hearings pursuant to FCC, "Telegraph Division Order No. 12."

All rates beginning with the 1946 increase are derived from official tariffs filed with the FCC.

The census report, *Special Reports: Telephones and Telegraphs, 1902*, states (p. 14) that the first telegraph rate was applicable in 1845 between Baltimore and Washington and was one cent for each group of four characters. The rates shown here are mainly those of the Western Union Telegraph Company. During some of the early years, lower rates were sometimes published by competing companies. The frequent changes in the New York-Chicago rate illustrate particularly the effects of competition. New companies appeared offering lower rates on this basic route and Western Union was forced to meet the competition until such time as it succeeded in acquiring the competing company. Moreover, it is not certain that the published rates were adhered to uniformly, particularly in the early years of telegraph development and in periods of depression. Under the stress of competition, rebates were sometimes allowed.

The rate for the full-rate telegram is the keystone of the telegraph rate structure. Rates for most other public message telegraph services (day letters, night letters, etc.) are a percentage of the rates for the full-time telegram. Between 1908 and 1946, there was no change in the level of the full-rate telegram, except for the increase effected in 1919. However, while maintaining the rate level on its full-rate telegrams, Western Union introduced various new classifications (including the fixed text social message and serials) which in effect provided discounts to the message customer.

TWX is provided only by the Bell Telephone System but this service was sold to Western Union in 1971. As contrasted with message telegraph service, which is a 1-way communication service, TWX provides 2-way, instantaneous communication service between TWX subscribers. The maximum number of words which can be transmitted in the 3-minute rate period depends on the speed of the transmitting operator (provided by the subscriber) and the maximum rated speed of the TWX equipment. In addition to the charges for specific use (measured in time units and distance) of the facilities, TWX subscribers beginning July 1, 1953, were billed a monthly service charge of $10. This was increased to $40 on September 1, 1966, and to $45 on February 1, 1970, for 60-speed service.

R 75–88. General note.

The first successful cable linking North America with Europe was laid in 1866. Radio was not a significant factor in overseas telegraphy until 1920 when the newly formed Radio Corporation of America (RCA) entered the field as successor to Marconi Company of America. The record of hearings held in 1929 before the Committee on Interstate Commerce, United States Senate, 71st Cong., 1st sess., on S. 6, a "Bill to Provide for the Regulation of the Transmission of Intelligence by Wire or Wireless," contains (pp. 960-972) a list of submarine cables of the world, and the year in which each was laid. Few of these cables are now in use, having been replaced by circuits in telephone ocean cables laid since the mid-1950's and, since 1965, also by circuits in microwave radio relayed by satellite. Information on the beginnings of international radiotelegraphy appears in the *Report of the Federal Trade Commission on the Radio Industry* (1924).

The first overseas radio telephone service was opened in 1927 between New York and London by American Telephone and Telegraph Company. The only overseas telephone service available during 1921-1926 was to and from Cuba by means of cable.

The census data are derived from the special quinquennial census reports of the telephone and telegraph industries (see general note for series R 1-92). With respect to international telegraph, these reports suffer from two major shortcomings. First, the Bureau of the Census was unable to obtain from the Western Union Telegraph Company a division between its landline system and its cable operations with respect to plant and financial operations. Prior to the 1932 census, Western Union provided separate data for its cable operations only in the categories of messages and cable mileage. In the censuses of 1932 and 1937, Western Union also supplied operating revenue information for its cable system. The absence of Western Union's Cable Division from the census data on the ocean-cable companies largely accounts for the significant differences between the census data and the annual series with respect to telegraph plant book cost and depreciation reserves, operating revenues, operating expenses, and net income.

A second shortcoming of the census data is the lack of adequate coverage of the radiotelegraph industry. The financial information included in the 1922 and 1937 census compilations is seriously distorted because of the failure to exclude various activities of the Radio Corporation of America not related to its telegraph communications business. In the 1932 census, no information on radiotelegraph appeared, while in the 1937 census the published statistics relate only to messages and operating revenue. Consequently, the only census data shown with respect to radiotelegraph are the message statistics, and $9,515,000 in operating revenues included within the 1937 cable-radiotelegraph total.

R 75–77, R 79–81, R 83–88. Telegraph messages, plant, nautical miles of ocean-telegraph cable, operating revenues and expenses, Federal income taxes, net income, employees, and wages, 1907–1970.

Source: U.S. Federal Communications Commission, 1916–1928, unpublished data; 1929–1956, *Statistics of the Communications Industry in the United States*, 1955 and 1956 issues, table 19; 1957–1970, *Statistics of Communications, Common Carriers*, annual issues. Census data beginning 1907 are from the following U.S. Bureau of the Census reports (see general note for series R 1–92 for detailed description of sources): *Telegraph Systems: 1907*, pp. 10, 19; *Telephones and Telegraphs . . ., 1912*, pp. 165, 167; *Telegraphs, 1927*, pp. 19, 25; *Telephones and Telegraphs, 1937*, pp. 49, 52.

Annual data prior to 1929 were derived in part from annual reports of the carriers filed with the Interstate Commerce Commission. In large part, these data were obtained through field examinations by the staff of the FCC and from data supplied by the carriers upon specific request.

Figures include Hawaii and Puerto Rico for all years. There is no international telegraph industry in Alaska; however, international telegrams originating or terminating there are included in series R 75–77.

Cable and radiotelegraph messages (series R 75–77) include communications sent from, received in, and transiting the United States and its outlying areas. In addition, radiotelegraph messages include ship-shore messages, and domestic telegraph messages handled over radiotelegraph circuits prior to the closure of such circuits on June 30, 1942.

Plant and depreciation figures (series R 79–80) are on the basis of the currently effective systems of accounts. The radiotelegraph accounts became effective January 1, 1940, and the ocean-cable uniform system accounts January 1, 1943 (replacing an earlier cable accounts system promulgated by the ICC, effective January 1, 1914).

The miles of ocean cable (series R 81) as published have been adjusted in view of the fact that some of the cables were reported and tabulated in statute miles rather than nautical miles.

Federal income taxes prior to 1929 are included in operating expenses (series R 84) in amounts which are not ascertainable. The substantial decline in net income in 1912 compared with 1907 may have been accounted for in large measure by the introduction of depreciation charges which were absent from the 1907 accounts.

Included in employees and compensation (series R 87–88) are the foreign employees of the carriers. The reporting dates for number of employees have varied: For 1929–1934, as of the end of June; for 1935–1945, as of the end of December; for 1946–1970, as of the end of October.

R 78. Overseas telephone calls, 1921–1970.

Source: 73d Cong., 2d sess., *Report on Communication Companies*, House Report No. 1273, pt. III, No. 2, p. 1459 (1935); and American Telephone and Telegraph Company, unpublished data.

Figures include calls to and from ships on the high seas and most international points. Additional data on radiotelephone service are contained in the *Statistics of the Communications Industry in the United States*. See also *Census of Electrical Industries: Telephones and Telegraphs, 1937*, table 9.

R 82. Overseas countries served by direct radiotelegraph circuits, 1912–1970.

Source: U.S. Federal Communications Commission, unpublished data (supplemented and confirmed in *Report of the Federal Trade Commission on the Radio Industry* and *Report on Communication Companies*, House Report No. 1273, pt. III, No. 1, pp. 990, 998; pt. III, No. 4, pp. 3934, 3948, and 4188).

R 89–92. International cable and radiotelegraph rates and international telephone rates between New York City and selected cities, 1866–1970.

Source: 1866–1928, scattered sources as indicated below; 1929–1970, U.S. Federal Communications Commission, unpublished data.

New York to London. The first successful transatlantic cable was laid in 1866. James D. Reid, *The Telegraph in America* (1886), p. 748, indicates that the first telegraph rate on the cable (presumably New York to London) was $100 for 10 words. Three months later, the same source states, the rate was reduced to $50 and subsequently to $25. By 1868, the rate for 10 words had declined to $15.75, and in 1885 it stood at 40 cents per word. A staff document of American Cable & Radio, Inc., prepared in connection with FCC Docket No. 8777 (1948) indicates that the Western Union Telegraph Company had a 50 cents per word rate in 1884, and that on December 24 of that year the Commercial Cable Company entered the field with a rate of 40 cents per word. The same source indicates that the cable companies other than Commercial Cable reduced their rates to 12 cents per word on May 6, 1886, and Commercial Cable in turn lowered its per word rate from 40 cents to 25 cents. On September 16, 1887, Commercial Cable further reduced its rate to the 12 cent level. Then on September 1, 1888, all the cable companies raised their rate between New York and London to 25 cents per word.

Exhibit No. 190, introduced by RCA Communications, Inc., in the same hearing (Docket No. 8777) shows the same rates, but with somewhat different effective dates; while William Holmes, *History of Telegraph Rates, 1860 to 1913*, p. 23, cites rates which differ in part from those shown here.

In 1916, it became possible to send messages from New York to London through Canada via Marconi Wireless for 17 cents per full rate word. According to the Federal Trade Commission *Report on the Radio Industry*, p. 36, RCA, on March 1, 1920, began transmitting radiotelegraph messages to Great Britain. The rate initially was 17 cents per word, with an increase to 18 cents on January 1, 1921, and to 20 cents on April 15, 1923. At this point the international cable companies reduced their rate to 20 cents to meet the radio competition. Since then, the rates for cable and radio have been identical.

The rate reductions effective May 1, 1945, provided for a uniform 20 cents per word basic rate from the United States "gateway" cities to a large part of the world (see FCC, *Eleventh Annual Report for Fiscal Year Ended June 30, 1945*, p. 45). Effective May 1, 1946, all international cable and radiotelephone rates were established on a country-to-country basis at 20 cents and 30 cents per word, respectively.

The reductions in rates, effective July 1, 1950, are the result of "unification" of the full rate and the code rate on all cable and radiotelegraph service. The rates were unified at 75 percent of the existing rate per full-rate word. This had the effect of lowering the charge for full-rate messages but increasing the charge for code messages which at that time formed a substantial portion of international telegraph traffic.

New York to Cairo. Telegraphic communication between New York and Cairo began, probably, in 1870 or shortly thereafter. A Commercial Cable Company tariff book, dated January 1903, indicates a rate of 61 cents per word as of that time. A July 1905 tariff book of the Western Union Telegraph Company shows a New York-Cairo rate of 56 cents per word; 25 cents was the rate for the New York-London haul and 31 cents for the rate beyond London. No record has been found of rates in effect between 1905 and 1925. Data since 1925 are from the FCC based on filed tariffs and correspondence with companies.

New York to Tokyo. No specific record has been found dating the beginning of telegraphic communication with Tokyo. In the hearings before the Senate Committee on Foreign Relations, 54th Cong., 1st sess., Senate Document No. 194 (1896), conflicting testimony was presented with respect to the early rates. The Commercial Cable Company tariff book of January 1903 stated that the rate at that time was $1.76 per word. Shortly thereafter Commercial Pacific Cable Company opened its trans-Pacific cable and the rate fell to $1.53 per word. This rate included 12 cents per word for the domestic landline haul from New York to San Francisco, and $1.41 for the San Francisco-Tokyo leg. *Report on Communication Companies*, 73d Cong., 2d sess., House Report No. 1273, pt. III, No. 4, p. 3926, is the source of the New York-Tokyo rates between 1903 and 1929. FCC is the source of rates since 1929. For data on radiotelegraph rates lower than cable rates prior to 1925, see FTC, *Report on the Radio Industry*, p. 35, and testimony before the House Committee on the Merchant Marine and Fisheries, pursuant to H.R. 7357, 68th Cong., 1st sess., p. 170.

New York to Buenos Aires. The 1880 rate is stated in the *1956 Annual Report of the American Cable and Radio Corporation to Stockholders*, p. 16. Rates between 1882 and 1927 are derived from testimony before the Senate Committee on Interstate and Foreign Commerce, 71st Cong., 2d sess., on S. 6 (1929–1930) beginning p. 2201, and *A Half Century of Cable Service to the Three Americas* (1928) published by All America Cables, Inc. When radio service was opened in 1924 the rate was fixed at the same level as the existing cable rate. FCC is the source for rates since 1929.

New York international radiotelephone rates to selected cities. The first overseas radiotelephone service was opened on January 7, 1927, between New York and London. Service to Buenos Aires began April 3, 1930, and to Tokyo, December 8, 1934. The circuit to Cairo, opened August 8, 1932, operated via London until January 7, 1946, when a direct circuit to Cairo was placed in operation. As in telegraph, the Tokyo radiotelephone rate included a landline haul charge until 1946 for the New York–San Francisco haul. Initially $9.00, the landline charge was reduced to $6.75 on July 1, 1937, and to $4.50 on August 1, 1940. All radiotelephone rates presented are for 3 minute weekday person-to-person daytime calls. In addition, there are lower night and Sunday rates on some routes, and on three of the routes station-to-station service is available at either a 25-percent or a 33⅓-percent discount from the person-to-person rates.

Series R 1–12. Telephones and Average Daily Conversations (Bell and Independent Companies): 1876 to 1970

[In thousands, except series R 2 and R 3. Census figures in *italics*]

[1] Beginning 1957, excludes drop and block wire.
[2] Includes miscellaneous revenues not shown elsewhere.
[3] Excludes Federal income taxes.
[4] Nonoperating income including Western Electric income less non-operating deductions from income.
[5] Excludes intercompany payments.
[6] As of Dec. 31.
[7] Represents net loss.

Series R 31–45. Independent Telephone Companies—Property, Revenues, Expenses, Interest, Net Income, Dividends, Employees, and Wages: 1916 to 1970

[**In thousands, except series R 31 and R 44.** Census figures, in *italics*, represent "systems and lines"; see text. Includes Alaska and Hawaii for all years]

– Represents zero.

[1] Includes minor amounts for Hawaiian Telephone Co.

[2] Excludes Federal income taxes.

[3] Figures in parentheses represent reversal of income taxes charged in previous years. The Western Union Telegraph Company has numerous items deductible from taxable income, but not recorded in the accounts as income deductions; this accounts for the fact that it reported net income in the late sixties with no concurrent liability for income taxes.

[4] This figure is affected by the $18,126,223 loss on the sale of the Western Union cables system recorded as a cables loss and the $8,250,000 tax reduction therefore recorded as a domestic telegraph gain.

[5] Figures represent net loss.

[6] Excludes wire owned and operated wholly by Class I railroads and landwire of ocean-cable companies.

NA Not available.
[1] Beginning Sept. 1, 1951, minimum charge for 15 text words or less; prior to that, for 10 text words or less.
[2] Prior to September 1966, telephone company rates for 3 minutes or less, 2-way; thereafter, for each minute or fraction thereof. Since 1959, the telegraph company has offered similar service called "Telex" with a different rate structure.
[3] Beginning of service.

Series R 75–88. International Telegraph Industry—Messages, Property, Ocean-Cable Mileage, Countries Served by Radiotelegraph, Revenues, Expenses, Net Income, Employees, and Wages: 1907 to 1970

– Represents zero.

[1] Numbers of cable and radio telegraph messages depend on whether they were reported by what were formerly known as cable or radio carriers. Since 1956, radio carriers have been using circuits in cables in addition to radio for transmission of messages; since 1965, cable carriers have been using radio circuits via satellite relay in addition to cables.

[2] Overseas telephone calls inserted for information purposes only; not handled by International Telegraph Industry. Beginning 1956, includes Alaska, Guam, and Virgin Islands. Excludes calls over landwire to Canada and Mexico.

[3] Number of overseas countries served by direct radiotelegraph circuits decreased during the sixties as they were displaced by submarine cable and satellite circuits; even some of the remaining circuits are for fallback use only.

[4] Excludes Federal income taxes.

[5] Prior to 1929, employment and compensation figures represent incomplete reportings to FCC by all carriers.

[6] Figure represents net loss resulting from the sale, charged against income, of a cable system.

[7] Figures represent net loss.

[8] As of September 16.

Series R 89–92. International Cable and Radiotelegraph Rates and International Telephone Rates Between New York City and Selected Cities: 1866 to 1970

[Prior to 1924, rate changes are for messages by cable only (except as noted for radiotelegraph messages). Since 1924, rate changes are for both cable and radiotelegraph messages]

Chapter R

Radio and Television (Series R 93-162)

R 93–162. General note.

Federal regulation of radio communication has been continuous since 1912 when the Department of Commerce was given authority to license radio equipment and radio operators, and broadcast stations, which began operation in 1921. On February 23, 1927, Congress established the Federal Radio Commission with broad authority for the regulation of radio. In 1934, the powers of the Federal Radio Commission were transferred to the Federal Communications Commission.

Principal governmental sources of statistics in respect to broadcast and nonbroadcast radio services include the following:

1. U.S. Bureau of the Census, *Census of Business, 1935: Radio Broadcasting*; Fifteenth Census Reports, *Population*, vol. VI, *Families*, 1930; Sixteenth Census Reports, *Housing*, vol. II, part 1, 1940; *U.S. Census of Housing: 1950, 1960*, and *1970*, vol. I, part 1.
2. U.S. Department of Commerce, *Annual Report of the Secretary of Commerce*, 1913–1926.
3. Federal Radio Commission, *Annual Report of the Federal Radio Commission*, 1927–1933; *Commercial Radio Advertising*, 1931.
4. U.S. Federal Communications Commission, *Annual Report of the Federal Communications Commission*, 1938–1970; *Report on Chain Broadcasting*, 1941; *The Public Service Responsibilities of Broadcast Stations*, 1946; "An Economic Study of Standard Broadcasting," October 1947 (processed); House Report No. 1297, 85th Cong., 2d sess., *Network Broadcasting*, 1958.
5. House Report No. 1273, 73d Cong., 2d sess., *Report on Communication Companies*, 1934.

Since 1937, the FCC has obtained annual financial reports from networks and broadcast stations. Statistical tabulations of the data so reported have been made available by the FCC in its annual reports; in its annual *Statistics of the Communications Industry in the United States;* and in annual processed reports. Unlike the telephone and telegraph industries, radio broadcasting is not classified as a common carrier and is not subject to rate or earnings regulation. The FCC, therefore, does not prescribe a uniform system of accounts for the radio industry. However, the Commission's Annual Report Form No. 324, and the accompanying instructions, ensures general uniformity in the reported data. The individual financial reports of networks and stations filed with the FCC are not available for public inspection. However, some individual network and station data have been published from time to time, as for example, in a Committee Print, 84th Cong., 2d sess. (Senator John W. Bricker), *The Network Monopoly: Report Prepared for Use of the Committee on Interstate and Foreign Commerce*, 1956; *Monopoly Problems in Regulated Industries; Hearings before the Antitrust Subcommittee of the Committee on the Judiciary*, 84th Cong., 2d sess., 4 vols., part 2, 1956.

R 93–97. General note.

Statistics of broadcast stations are commonly presented in terms of "authorized" and of "licensed" stations. A broadcast station is authorized when it receives a construction permit from the U.S. Federal Communications Commission (or predecessor licensing agencies). Normally, a station is expected to complete construction and begin regular operation within 8 months thereafter. However, not all authorized stations complete this process and become operating stations. This has occurred mainly in the broadcast services of frequency modulation (FM) and television (TV).

Similarly, statistics of "licensed" stations can be misleading. A station permittee who has completed construction in accordance with the specifications of the construction permit or a modification thereof, usually receives a regular license, prior to start of regular on-the-air program service. However, for a variety of reasons, the FCC has permitted stations to undertake regular broadcast service under a Special Temporary Authorization. Many stations have operated under such authority for a number of years. Here, again, this statement applies particularly to FM and TV stations.

Figures for these series are for the most part presented in terms of operating stations. Stations are recorded in FCC records as operating when they have received permission to conduct program tests. In some instances, considerable time may elapse before such stations are in regular, daily operation. Adjustments for this factor have been made by the FCC on the basis of trade sources, and such adjustments are incorporated here. In sum, the data on operating stations are not precise, but are believed to be reasonably accurate.

R 93. Standard broadcast (AM) stations operating, 1921–1970.

Source: 1921, U.S. Federal Communications Commission, unpublished data; 1922–1926, *Annual Report of the Secretary of Commerce*, various issues; 1927–1932, *Seventh Annual Report of the Federal Radio Commission for Fiscal Year 1933*, p. 18; 1933–1970, FCC, *Annual Report*, various issues.

Prior to 1948, data pertain to licensed stations which, in the AM service, generally approximated operating stations.

Figures are not available annually on the number of noncommercial AM stations because there is no separate noncommercial service. Usually, such stations are supported by educational or public bodies. In the early growth of radio prior to 1927, educational institutions were prominent in radio (see S. E. Frost, *Education's Own Stations; the History of Broadcast Licenses Issued to Educational Institutions*, University of Chicago Press, 1937). From 1945–1970, the number of noncommercial AM stations declined from about 35 to 25. In addition, a small number of educational institutions operate commercial stations.

The decline in the number of AM stations between 1927 and 1929 followed the transfer of the licensing function from the Secretary of Commerce to the Federal Radio Commission. The latter body tightened the licensing requirements, resulting in the withdrawal or deletion of a number of operating stations.

R 94–95. Frequency modulation (FM) stations operating, 1940–1970.

Source: U.S. Federal Communications Commission, *Annual Report*, various issues.

FM was authorized as a regular service in 1940, effective January 1, 1941, and the first commercial station was licensed in 1941. Noncommercial FM is a separate service with a specific spectrum allocation. The stations are licensed to nonprofit educational organizations.

R 96–97. Television (TV) stations operating, 1941–1970.

Source: See source for series R 94–95.

Television was authorized on a regular commercial basis, effective July 1, 1941, and 2 stations in New York began operating as of that

date. Figures include very high frequency (VHF) stations, first authorized in 1941, and ultra high frequency stations (UHF), first authorized in 1952. Some stations (almost entirely UHF stations) began operation and subsequently ceased operation, but retained their FCC authorization. Such stations are not included in the years of nonoperation.

R 98–101. Cable television, 1952–1970.

Source: John Blair & Company, New York, N.Y., *Statistical Trends in Broadcasting*, annual issues (copyright).

Cable television (CATV) is a system whereby program signals are sent through a cable attached to a television set, as opposed to commercial television and on-the-air transmission of signals.

R 102–103. Sets produced, 1922–1970.

Source: Electronic Industries Association, 1922–1934, *Electronics Industry Fact Book*, 1957, pp. 4, 5; 1935–1970, *Electronic Market Data Book*, 1971. (Copyright.)

Figures are based on reports of members of the Electronic Industries Association (formerly Radio-Electronic-Television Manufacturers Association) adjusted for estimated production of nonmembers. The figures also include sets produced for export. Radio set figures include home sets for all years; auto sets, 1930–1970; portable sets, 1939–1970; and clock sets, 1951–1970. As of 1970, automobile sets constituted over 40.3 percent of total radio-set production. As of 1970, year end, Electronic Industries Association estimated that there were 336 million radio sets in working order in the United States, including 85 million in automobiles.

R 104. Households with radio sets, 1922–1970.

Source: Annual figures, National Broadcasting Company (NBC), unpublished estimates. U.S. Bureau of the Census data, as follows: 1930, Fifteenth Census Reports, *Population*, vol. VI, *Families*, table 39; 1940, Sixteenth Census Reports, *Housing*, vol. II, part 1, table 10; 1950, 1960, and 1970, *U.S. Census of Housing: 1950*, vol. I, part 1, table 13; *1960*, vol. I, part 1, table 7; *1970*, vol. I, part 1, table 34.

NBC accredits data on radio ownership prior to 1950 to the National Association of Broadcasters (NAB), which is the national trade association of broadcasters, and to Broadcast Measurement Bureau, a private survey group, which conducted a detailed nationwide survey of radio listening. A survey conducted by the Columbia Broadcasting System (CBS), the results of which were published as "Lost and Found," purported to show 2,450,000 households with radios not enumerated in the 1930 Census of Population. Accordingly, the NAB adjusted the 1930 census figure to 14,499,000. Similarly, 964,026 occupied dwelling units did not report concerning radio ownership in the 1940 Census of Population. The NAB estimated that 786,043 of these should be added to the 1940 census figure of 28,048,219 occupied units with radio.

The figures include radio sets which may not be in working order. Sets temporarily out of order or being repaired at the time of enumeration were included in the census data. The figures exclude radio sets in places of business, institutions, and hotels.

R 105. Households with television sets, 1946–1970.

Source: National Broadcasting Company, unpublished estimates. U.S. Bureau of the Census data as follows: 1950, 1960, and 1970, *U.S. Census of Housing: 1950*, vol. I, part 1, table 13; *1960*, vol. I, part 1, table 7; *1970*, vol. I, part 1, table 34.

An indication of the accuracy of the estimates is provided by several surveys of TV ownership in the Nation's households conducted by the Bureau of the Census for the Advertising Research Foundation. These studies have yielded the following estimates:

	June 1955	*March 1956*	*August 1956*	*January 1969*
Total sets in TV homes	33,269,000	37,277,000	39,568,000	79,660,000
TV homes	32,106,000	35,495,000	37,410,000	58,250,000
Second sets in TV homes	1,163,000	1,782,000	2,158,000	21,410,000
TV homes as percent of total homes	67.2	72.8	76.1	95.0

All figures exclude sets in places of business, institutions, and hotels, but include households with television sets which may not be in current working order.

R 106–109 and R 123–126. Radio and television advertising expenditures, 1935–1970.

Source: 1935–1956 and 1958–1968, *Printers' Ink Advertisers' Guide to Marketing*, various issues; 1957, *Printers' Ink*, Feb. 6, 1959, p. 9; 1969 and 1970, *Marketing Communications*, July 1971.

Historical-time series on advertising expenditures were first developed by L. D. H. Weld of the McCann-Erickson Advertising Agency, New York, in 1938. After Dr. Weld's death in 1946, McCann-Erickson continued to prepare the estimates under the supervision of Dr. Hans Zeisel and, since 1950, Robert J. Coen.

Total advertising expenditures in radio and television are total time sales of networks and stations including commissions of advertising agencies and station representatives, as reported by the Federal Communications Commission, multiplied by estimated "adjustment" factors. For a description of the method used in developing the annual adjustment factors, see the source. Total advertising expenditures are larger than total broadcast revenues as reported by the FCC in two respects: The inclusion of commissions paid to advertising agencies and station representatives; and the inclusion of sums paid by advertisers for talent, program, and production to organizations which do not operate networks or broadcast stations (included in the "adjustment" figures).

The networks included in radio are the four national networks—American Broadcasting Company (ABC), Columbia Broadcasting System (CBS), National Broadcasting Company (NBC), and the Mutual Broadcasting System (MBS). The three large regional networks included for most years are the Don Lee Network, the Yankee Network, and the Texas State Network. The networks included in television are ABC, CBS, NBC (each of which operates a network in both radio and television) and, until September 1955, the DuMont Network. At that time DuMont withdrew from the network field.

For a detailed discussion of the network system, see the FCC and other reports listed in the general note for series R 98–162; and 84th Cong., 2d sess., Robert F. Jones, *Investigation of Television Networks and the UHF-VHF Problems; Progress Report Prepared for the Committee on Interstate and Foreign Commerce*, 1955.

R 107 and **R 124**, network expenditures. Figures are total expenditures of network advertisers in radio or television for time (i.e., access to the individual stations broadcasting the program); for the program, including talent and production; and for the production of the commercial announcements. Such sums include commissions to advertising agencies but exclude discounts and allowances received by the advertiser. The figures are before disbursements by the networks to their affiliated and owned stations, and exclude the nonnetwork time sales of the stations owned by the networks.

R 108 and **R 125**, national spot expenditures. This type of advertising is commonly confused with commercial, or "spot," announcements. The term "spot" in this context refers to the purchase of time by national advertisers on individual stations "spotted" or selected in various communities. Predominantly, the advertiser expenditures are for commercial announcements adjacent to network or other programs carried by the individual stations. In addition, national spot advertisers sponsor programs or purchase "participations" in station-supplied programs. Thus, national spot advertiser expenditures include total time sales (after discounts but

including commissions to advertising agencies and station representatives) multiplied by an estimated "adjustment" factor for program and production.

R 109 and **R 126,** local advertising expenditures. These include total time sales (after trade discounts but including commissions to advertising agencies) multiplied by an estimated "adjustment" factor for program and production. Local advertiser expenditures are made both in connection with the broadcast of commercial announcements and the supply of a program service. The main distinction between national spot and local advertising is as follows: National spot advertisers are connected with firms or companies which produce or distribute goods or services on a national or regional basis, and which usually place their advertising message on a number of selected stations. Local advertisers are usually local retailers and other organizations whose goods or services are primarily for local distribution. As such, a local advertiser will place his advertising message only on the stations in his community or marketing area. However, in practice, the "national" and "local" categories are not completely differentiated.

R 110–122 and R 127–139. Networks and stations reporting, broadcast revenues, expenses, income, gross investment, and employees, 1935–1970.

Source: U.S. Bureau of the Census, 1935, *Census of Business, 1935, Radio Broadcasting,* pp. 15, 25; U.S. Federal Communications Commission, 1937–1947, *Annual Report,* various issues; 1948–1970, *AM-FM Broadcast Financial Data* and *TV Broadcast Financial Data,* various issues.

The basic sources of figures shown in the *Annual Report* are *Statistics of the Communications Industry in the United States,* annual issues, and processed releases of the FCC.

FCC began the regular annual collection of financial and operating data from networks and stations in 1937. The respondents each year usually include over 90 percent of commercial stations in operation, accounting for well over 95 percent of total industry revenues, expenses, and income. Statistics based on these reports, particularly prior to 1952, have included considerable detail. These statistics have been made available to the public in the *Annual Report* of the FCC, 1938–1970; *Statistics of the Communications Industry in the United States,* annual issues; and in processed releases.

R 110–111 and **R 127–128,** reporting networks and stations. Prior to 1949 the radio data are limited to commercial standard broadcasting (AM) stations and networks operating in the United States, Puerto Rico, and outlying areas. Since 1949, the radio data also include reports of joint AM-FM stations, and reports of FM-only stations. The television data include stations operating in the United States, Puerto Rico, and outlying areas.

R 112–114 and **R 129–131,** broadcasting revenues. Figures include the amounts received by networks and stations from the sale of time (net of all trade and cash discounts and commissions to advertising agencies and station representatives) and from other broadcast activities as follows: Gross amount received for services of talent under contract to and in the pay of networks or stations; net commissions, fees, and profits for services in obtaining, or for placing with others, talent not under contract to and in the pay of respondent; amounts received for furnishing manuscripts, transcriptions, productions, or other program materials or services; and amounts received for incidental broadcast activities such as charges for studio facilities and special charges in connection with remote broadcasts, fees or other charges for conducting studio tours, and fees or profits received for the right to operate concessions.

R 115–117 and **R 132–134,** broadcasting expenses. The broad expense categories reported include technical, program, selling, and general and administrative expenses. Among the expenses required to be included are the following: Salaries and wages; talent expenses; film and transcription expense; commissions to staff salesmen; insurance; depreciation and amortization of broadcast investments; rents paid for use of broadcast property; taxes (other than Federal taxes on income); and losses on notes, accounts, and other amounts receivable.

R 118–120 and **R 135–137,** broadcasting income. Figures represent net operating revenues (before Federal income tax), excluding income derived by the networks and stations from sources and operations other than broadcasting.

R 121 and **R 138,** gross investment. Figures represent investment in tangible broadcast property, before depreciation. The FCC report form requires that the costs be reported on an original-cost basis, and not on the basis of cost readjustments resulting from the sales or transfers of stations. Tangible broadcast property includes land and buildings, if owned, and transmitter and studio property; it excludes financial assets and good will. In the case of stations which have been sold, it represents that portion of the price assigned by the licensee to the property. Tangible broadcast property is, therefore, not a measure of total investment in broadcasting.

R 122 and **R 139,** employees. Figures include all employees, staff and nonstaff, full and part time, not excluding general officers and other managerial officials, but excluding "uncompensated" employees. Figures for 1935 are employees reported as of the 15th of each month, summed and divided by 12; 1938, week beginning Dec. 11; 1939–1943, middle week in October; 1944–1946, as of Dec. 31; 1946–1948, middle week in October; 1955–1970, as of Dec. 31.

R 140–148. Safety and special radio stations authorized, by class, 1913–1970.

Source: 1913–1926, U.S. Department of Commerce, *Annual Report of the Secretary of Commerce,* various issues; 1927–1934, Federal Radio Commission, *Annual Report,* various issues; 1935–1970, U.S. Federal Communications Commission, *Annual Report,* various issues.

Prior to 1948, the only data available to measure the use of radio in various nonbroadcast safety and special radio services were the number of authorized stations. The term "station," however, has not had a uniform significance among these services or within the same service over time. Primarily, the term reflects licensing procedures. A station is a single authorization issued by the FCC (or its predecessor licensing agencies) authorizing the use of one or more transmitters on assigned frequencies. A station may include one of the following: One or more transmitters at a fixed (land or fixed stations) location; one or more mobile transmitters; a system including a transmitter at a fixed location and one or more mobile transmitters or one of these in a combination with more than one frequency. Within most of the services, station authorizations have been changed from one to another form in an effort to simplify licensing procedures. As a result, year-to-year changes in the number of stations must be interpreted with caution, particularly if a decrease is shown.

Most of the nonbroadcast radio services are grouped together as the safety and special radio services, which constitute the greatest number of radio stations licensed by the FCC. Utilization of these services by individuals, industry, commerce, and State and local governments cover broad fields of operations in connection with protection of life and property, industrial and agricultural production, transportation, disaster, and civil defense.

R 149–162. Authorized land stations and mobile transmitters in the safety and special radio services, 1948–1970.

Source: See source for series R 140–148.

The distinctive characteristics of a land station are that it is located at a fixed site, has a fixed antenna and a panel control, and is used for communication in the mobile services (aviation, land

transportation, etc.). In the land mobile radio services, a land station is referred to as a base station. Thus, in the taxicab radio service, the base station is used to send and receive communications to and from the associated mobile transmitter-receivers located in the taxicabs. In the marine radio services, coastal stations are examples of land stations, and in the aviation radio services, aeronautical stations are the land stations.

Fixed stations are similar to land stations but are employed in the nonmobile radio services to communicate, or transmit messages, to other land points.

Mobile transmitters, as the name implies, are installed in moving vehicles, or are hand carried or are used as pack set units. They have relatively simple antenna and switching equipment and, in conjunction with a receiver, are used for transmitting and/or receiving information. Such transmitters usually tie in with a land station, the latter serving as a central control point for communicating with the various mobile units.

One major shortcoming of the transmitter data, however, is that they measure authorized rather than operating transmitters. This divergence is not too great in the case of the land or fixed transmitters. It is estimated that over 90 percent of the authorized transmitters are in operation. However, an entirely different situation prevails with respect to mobile transmitters. The number of mobile transmitters is an approximation of the number of transmitters in actual operation. Approximately 50 percent of the authorized mobile transmitters are included in these figures. Licensees, in applying for authorizations, have wide latitude in estimating the number of mobile units they expect to have in operation within the license period.

See also text for series R 140–148.

★★★★★★★★★★ **More Recent Data for *Historical Statistics* Series** ★★★★★★★★★★

Statistics for more recent years in continuation of many of the still-active series shown here appear in annual issues of the ***Statistical Abstract of the United States***, beginning with the 1975 edition. For direct linkage of the historical series to the tables in the ***Abstract***, see Appendix I in the ***Abstract***.

Series R 93–105. Radio and Television Stations, Sets Produced, and Households With Sets: 1921 to 1970

* Denotes first year for which figures include Alaska and Hawaii.
– Represents zero.
Z Less than 0.05 percent.
[1] Includes Alaska, Hawaii, Puerto Rico, Guam, and Virgin Islands for all years. Prior to 1948, the FCC did not keep records on the number of stations on the air. Therefore, data for 1933–1948 are for authorized stations and may include a number that were not actually on the air.
[2] No production in Alaska and Hawaii.
[3] In 1970 Census of Housing, only battery-operated radios were enumerated.
[4] Authorization of new radio stations and production of radio receivers for commercial use halted from April 1942 until Oct. 1945.
[5] First station to receive regular license as of Sept. 15; other stations in operation experimentally.

[1] Data for "Citizens" are included with "Land transportation" before 1960.
[2] Includes Class 2 experimental stations as follows: 46,085 taxicab units and 668 trucks and buses.
[3] Includes 30,000 Class 2 experimental taxicab units.
[4] Includes 68 Class 2 experimental industrial units.

Chapter R

Postal Service, Newspapers, and Books (Series R 163-257)

R 163. Post offices, 1789–1970.

Source: U.S. Post Office Department, *Annual Report of the Postmaster General, 1970.*

The source also presents a classification of the number of post offices into first, second, third, and fourth class for 1946–1970.

R 164–165. Revenues and expenditures, 1789–1970.

Source: See source for series R 163.

For 1789–1953, revenues and expenses are stated on a cash basis and therefore include payments and receipts in one year applicable to the expenses and revenues of prior years. For 1954–1962, revenues and expenses are stated on an accrual basis, with expenses reported in the year which gave rise to the earnings, whether collected or accrued. For 1963–1970, revenues and expenses are stated on an accrued cost basis.

Comparability of figures from year-to-year are affected by various factors. For example, the Post Office discontinued payment of subsidies to airlines in 1954; the Department also began receiving reimbursement for penalty and franked mail in 1954, costs which the Post Office had previously absorbed.

Expenses include expenditures for plant and equipment of a capital nature and for inventories and supplies, but no provision for depreciation is made. Expenses also include certain public service costs paid by the Post Office Department, but which the Department considered to be unrelated to the determination of the proper operating costs of the Postal Service. These include unreimbursed services for other Government agencies; specific rate subsidies for mailings of second- and third-class mail by certain nonprofit organizations, free-in-county second-class mail, classroom publications, and mail for the blind; excess rates paid to foreign air carriers; and custodial services for other Government departments and agencies. These costs were estimated to have been approximately $740 million for 1970.

Expenses of the Post Office Department do not include costs applicable to postal operations which are paid by other Government departments and agencies for retirement pay accrual, workmen's compensation and unemployment compensation for postal employees, and certain custodial and maintenance expenses. These expenses amounted to $424 million in 1970.

R 166–167. Ordinary postage stamps and stamped envelopes and wrappers issued, 1848–1970.

Source: See source for series R 163.

R 168. Postal cards issued, 1873–1970.

Source: See source for series R 163.

The Government postal card was authorized in 1872. The post card, or private mailing card, was introduced in 1898. The rate for this service has been practically identical with that of the postal cards. Business reply cards and letters as a postal service was initiated in 1928.

R 169. Pieces of matter of all kinds handled, 1886–1970.

Source: See source for series R 163.

With the establishment of the cost ascertainment system in 1926, data on the volume of mail have been obtained from sample counts conducted quarterly for one week at representative post offices, ranging in number from 255 to over 500. These sample data were then projected to include all originating mail at all post offices in the United States. The methods of estimating the number of pieces of matter handled prior to 1926 could not be ascertained. See also general note for series R 172–186.

R 170. Surplus or deficit, 1926–1970.

Source: See source for series R 163.

The Post Office Department operated with a deficit in fiscal year 1970 as it had in all but a few years of its history. The last period in which there was a surplus was during the three World War II years, 1943 through 1945.

The accounts of the Department are maintained in such a way as to reflect the deficit in three ways—the cash deficit, the operating deficit, and the postal fund deficit. The "cash deficit" represents the excess of disbursements over receipts. The "operating deficit," which is utilized in the series, represents the excess of expense over income. The "postal fund deficit" represents the excess of obligations incurred over postal revenues.

R 171. Sales of postage stamps and other stamped paper, 1937–1970.

Source: See source for series R 163.

R 172–186. General note.

The bulk of postal revenues and postal expenses cannot be allocated directly to the various classes of mail handled or to special services performed.

Postal revenues (except for about 10 percent which can be directly allocated or computed) are derived from postage acquired in the form of stamps and stamped paper and from payments under permits, which may be used by the purchaser generally on any class of mail. The result is a large common pool of revenues from numerous sources. Similarly, the several classes of mail and the special services are to a considerable extent handled by the same employees using the same buildings, equipment, operating facilities, house services, and supplies.

Pursuant to a Congressional Act of February 28, 1925 (39 U.S.C. 826), a regular, continuing cost ascertainment system was established in 1926 to collect and develop data on the revenue received (including volume and weight of mail) and cost incurred by the Post Office Department. This system was succeeded by the revenue-cost analysis system which incorporated incremental costs concepts into the system for the first time. The latter system represents the culmination of many changes and improvements for the Revenue and Cost Analysis Report (formerly the Cost Ascertainment Report).

The statistics of expenses as published annually are subject to later readjustments as a result of increases in the charges of railroad, air, or other transportation services, or increases in the salaries of Post Office Department employees, if such increases are made retroactive to an earlier fiscal year.

R 172–174. First-class mail, 1926–1970.

Source: U.S. Post Office Department, 1926–1946, *Budget Digest,* 1949, chapter IV, tables 5–11; 1947–1968, *Cost Ascertainment Report,* 1956, 1958, and 1968 issues; 1969–1970, *Revenue and Cost Analysis,* 1970.

Figures cover letters, matter wholly or partially in writing or typewriting, and packages (including local delivery letters), single or double postal and post cards, bills and statements of account, and matter closed against postal inspection. Each piece may not weigh more than 70 pounds or measure more than 100 inches in length and girth combined. Postage may be paid by adhesive stamps, stamped cards or envelopes, meter stamps, or permit imprint. For 1926–1929, domestic airmail could not be segregated and is included with first-class mail. Mail fees are included for 1950–1970. Box rent revenues, previously reported as unassignable are allocated to classes of mail, 1951–1955, and classified with special services for 1956–1970. For 1951–1970, the expense of free mail from members of the Armed Forces is included in first-class mail expenditures.

See also text for series R 188–189.

R 175–177. Second-class mail, 1926–1970.

Source: See source for series R 172–174.

Newspapers and periodical publications, both domestic and foreign, which meet all of the requirements set forth in part 132, Postal Service Manual, may be mailed at the second-class rates of postage. Revenues include postage payments (stamps or money order permit) and, since 1932, payment of fees for use of the second-class privilege; transient second-class matter (mailings of second-class publications by other than the publisher or news agents); publishers' second-class matter forwarded or returned, 1950–1970; mailing fees, 1951–1970; and box rent revenue allocation, 1951–1970.

Expenses include cost of publishers' second-class matter forwarded or returned, 1950–1970, and, for 1953–1970, also includes the expense of sending notices to publishers regarding undelivered mail.

R 178–180. Third-class mail, 1926–1970.

Source: See source for series R 172–174.

Third-class mail embraces all matter less than 16 ounces in weight and not qualifying as first or second class. A significant proportion of the matter mailed under third class is advertising material. Also included are keys, identification cards and tags, or similar identification devices that are without cover and bear, contain, or have securely attached the name and complete post office address of a person, organization, or concern with instructions to return to such address and a statement guaranteeing the payment of the postage due on delivery. In 1928, a special "bulk rate" was made applicable to separately addressed identical pieces of third-class matter mailed at one time. The present law requires such matter be mailed in quantities of at least 50 pounds or at least 200 pieces. Also, there is a single piece third-class rate. Revenues include postage revenues and fees for permits; domestic mail fees, 1951–1970; and box rent revenue allocation, 1951–1970.

Prior to 1953, the revenues and expenses applicable to controlled circulation publications (publications consisting primarily of advertising and distributed free or mainly free) were included with third-class and fourth-class services. For 1953–1970, controlled circulation publications are shown separately.

R 181–183. Fourth-class mail, 1926–1970.

Source: See source for series R 172–174.

This class includes mailable matter 16 ounces or more in weight, not qualifying as first or second class. The major development in this class of mail was the establishment of the parcel post system effective January 1, 1913. Books, special fourth-class and library rate items, catalogs, and matter for the blind, included in fourth class, carry special rates. Mailers of fourth-class articles may use any method of paying postage. Revenues include domestic mail fees for 1951–1970; box rent revenue allocations, 1951–1970; and special handling fees.

R 184–186. Domestic airmail, 1929–1970.

Source: See source for series R 172–174.

Since September 1948, domestic airmail includes a parcel post service and since January 1949 airmail postal and post card service. Paid airmail to and from the Armed Forces overseas and the outlying areas of the United States, formerly in international airmail, is included with domestic airmail, 1947–1970. For 1951–1970, airmail expenses include the cost of free mail from members of the Armed Forces.

Airmail expenditures include subsequent payments, as of June 30, 1950, to airlines for retroactive rate increases where effective. The decline in airmail expenses between 1953 and 1954 resulted from the transfer of subsidy payments to airlines from the Post Office Department to the Civil Aeronautics Board effective October 1, 1953. The *Cost Ascertainment Report* for 1953 and prior years shows division of service costs and subsidy payments.

For 1954–1970, the Post Office Department experimented with the transporting of all mail by air between a number of major cities. Such mail, carrying first-class postage, is counted within first-class service.

R 187. Post Office employees, 1926–1970.

Source: U.S. Post Office Department, *Annual Report of the Postmaster General, 1970.*

Included are regular or full-time employees and substitute, hourly rate, and part-time employees. Part-time employees are a substantial part of the Post Office labor force.

Prior to October 1933, the operating force for public buildings housing post offices and other Government agencies was on the rolls of the Treasury Department. On that date, the personnel were transferred to the Post Office Department. This increased the regular labor force of the Post Office Department by 8,000 employees.

R 188–190. Postal rates for first-class mail, letters and postal cards, 1792–1970.

Source: 1792–1956, U.S. Post Office Department, *United States Domestic Postage Rates, 1789–1956*, table I; 1958–1970, Public Law 85-426 (Postal Policy Act of 1958), Public Law 87-793 (Postal Service and Employee Salary Act of 1962), and Public Law 90-206 (Postal Service and Employee Salary Act of 1967).

The postage rates in effect in 1789 were those fixed by the Continental Congress in the Ordinance of 1782. These rates were continued until 1792. It was not until 1863 that mail was divided into "classes." In the early days of the postal service the recipient rather than the sender ordinarily paid the postage. In 1847 postage stamps were introduced, and in 1885 compulsory prepayment for all domestic letter mail was established.

The rates shown are for regular service. During the earlier years of the westward expansion, special local rates were often improvised. Thus, the first letter rate on the "pony express," which operated between Missouri and California from 1860 to 1861, was $5 for a half ounce, reduced in May 1861 to $2 for a half ounce, and in July 1861 to $1 for a half ounce because of a Government subsidy.

A considerable part of the domestic mail service between 1792 and 1863 was carried by ship, and was subject to shipletter rates. These rates are detailed in the source, table II, p. 24. In 1863, a ship and steamboat rate, double the regular rate, was made applicable to domestic mail conveyed by ships not regularly employed in carrying mail. This classification is omitted after 1879 because of its diminishing importance but the double rate is still in effect although little or no matter is mailed under these rates.

In 1863, first-class mail was defined to include letters and matter wholly or partly in writing, except book manuscripts and corrected proof sheets. In 1872, first-class mail was described as including

letters and all correspondence, wholly or partly in writing, except book manuscripts and corrected proof sheets passing between authors and publishers. In 1879, it was redefined to include letters, postal cards, and all matter wholly or partly in writing, except such writing as is authorized to be placed on mail of other classes. See Jane Kennedy, "Development of Postal Rates: 1845–1955," *Land Economics*, May 1957 issue, pp. 93–112, for additional materials on postal rates, particularly rates for second-, third-, and fourth-class mail.

R 191. Postal rates for domestic airmail, 1918–1970.

Source: See source for series R 188–189, table III, p. 25.

Until 1948, domestic airmail rates applied not only to letters but also to other mailable matter, including sealed parcels up to specified maxima (prescribed according to weight or according to length and girth). Effective September 1, 1948, an Air Parcel Post Service was established. Matter carried by air weighing 8 ounces or less was classified as "airmail" and over 8 ounces "air parcel post." In 1968, air parcel post and first class mail weighing more than 13 ounces were combined and classified "priority mail."

R 192–217. New books and new editions published, by subject, 1880–1970.

Source: **Series R 192** and **R 193**, 1890, *Bookman Literary Yearbook*, 1898, Dodd, Mead Co. All other series reprinted from various issues of *Publishers Weekly*, published by R. R. Bowker Co., a Xerox Education Co., copyright © by Xerox Corporation.

Figures represent the number of titles published, not the number of books which were printed. Beginning 1967, books are counted by title rather than by volume. Beginning 1959, United Nations Educational, Scientific, and Cultural Organization definition of a "book" (a volume over 49 pages) was adopted. Previously, all hardbound books and all paperbacks that were specialized (workbooks, laboratory manuals, etc.), over 65 pages, or had mass market distribution, were counted. Years prior to 1959, therefore, are not strictly comparable with subsequent years. The data are compiled from information and actual books submitted to R. R. Bowker Company by the various book publishing firms. The source also contains the number of publications for some foreign nations.

R 218–223. Newsprint consumption and newspaper pages, 1940–1970.

Source: U.S. Domestic and International Business Administration, unpublished data.

R 224–231. Newspapers—number and circulation of daily and Sunday newspapers, 1920–1970.

Source: Editor and Publisher, New York, N.Y., *International Year Book Number*, various issues (copyright).

The term "daily" refers to papers that are published either morning or evening. About 90 percent of the circulation figures are credited by the Audit Bureau of Circulations. The remaining 10 percent is based on publishers' statements to the U.S. Post Office Department. The compilation is checked annually with a questionnaire to every daily newspaper in the country. The source also presents data for individual States.

[1] Excludes branches and stations.
[2] Accounting basis changed from cash to accrual basis in 1954; from accrual basis to accrued cost basis in 1963.
[3] First issued under act of Mar. 3, 1847, and placed on sale at New York, July 1, 1847.
[4] Stamped envelopes first issued June 1853, under act of Aug. 31, 1852.
[5] First issued May 1, 1873, under act of June 8, 1872.
[6] For 1918 and 1919, includes $44,500,000 and $71,392,000, respectively, war-tax revenue accruing from increased postage.
[7] Special-request envelopes first issued in this year.
[8] Newspaper wrappers first issued under act of Feb. 27, 1861; they were not made after Oct. 9, 1934.
[9] For 3 months only.

Series R 172–187. Postal Service—Revenues, Expenses, and Volume of Mail, by Classes of Mail, and Employees: 1926 to 1970

NA Not available.

[1] For 1926–1929, domestic airmail included with first-class mail.

[2] For 1951–1955, box rent revenue, previously classified as unassignable, allocated to classes of mail; thereafter, classified as "Special services."

[3] Beginning 1947, includes airmail to and from Armed Forces overseas, previously included with foreign mail. Beginning 1954, excludes reimbursement for airmail transportation.

[4] In fiscal year 1969 the department changed from a fully distributed cost system to an attributable cost system.

Series R 188–190. Postal Rates for First-Class Mail, Letters and Postal Cards: 1792 to 1970

[First-class mail as a mail category not officially established until 1863. Ship and steamboat letters, 1792–1863, carried special rates]

Year of rate change	Letters, nonlocal	Postal cards (cents)
	188	189
1968–1970	6¢ per oz.	5
1963	5¢ per oz.	4

201–250 miles	17
251–350 miles	20
351–450 miles	22
Over 450 miles	25

[1] The 1940 rate change provided that the 3¢ letter rate was not to apply to first-class matter for local delivery or for delivery within a county with a population of over 1 million if county was entirely within a corporate city.
[2] Government postal cards first authorized in 1872.
[3] A uniform rate regardless of distance, a free city delivery service, and a letter unit of ½ ounce instead of the former "single letter" were inaugurated.
[4] Rate between any point in the U.S. east of the Rocky Mountains and any State or Territory on the Pacific. For other rates, see those for 1855.
[5] A communication of 1 sheet. Proportionately higher rates charged for letters of 2, 3, and 4 or more sheets (packet).
[6] Various acts between 1847 and 1850 established special rates for the western and southwestern U.S.
[7] In 1825, rates for single letters, 151 to 400 miles, increased to 18¾ cents.
[8] Between 1794 and 1863, extra fees were charged for city delivery service. The proceeds went to the letter carrier.

Series R 191. Postal Rates for Domestic Airmail: 1918 to 1970

[Includes Alaska, Hawaii, Puerto Rico, and all outlying areas except the Canal Zone]

Effective date	Rate
	191
1968, Jan. 7 to 1970	10¢ per oz., 8¢ each for airmail postal and post cards
1963, Jan. 7	8¢ per oz., 6¢ each for airmail postal and post cards
1958, Aug. 1	7¢ per oz., 5¢ each for airmail postal and post cards
1949, Jan. 1	6¢ per oz., 4¢ each for airmail postal and post cards [1]
1948, Sept. 1	(2)
1946, Oct. 1	5¢ per oz.
1944, Mar. 26	8¢ per oz.
1934, July 1	6¢ per oz.

Effective date	Rate
	191
1932, July 6	8¢ first oz.; 13¢ each additional oz.
1928, Aug. 1	5¢ first oz.; 10¢ each additional oz.
1927, Feb. 1	10¢ per ½ oz., regardless of distance (both contract and Government-operated air routes)
1926, Feb. 15	Contract air routes: Under 1,000 miles, 10¢ per oz.; 1,000–1,500 miles, 15¢ per oz.; Over 1,500 miles, 20¢ per oz. — plus 5¢ per oz. for each airmail zone

Effective date	Rate
	191
1926, Feb. 15	Government routes: Daytime zone rate, 8¢ per oz. New York to Chicago (overnight), 10¢ per oz.
1925, July 1	10¢ per oz. for Goverment-operated overnight service New York to Chicago; 8¢ per oz. daytime zone rate
1924, July 1	8¢ per oz., per zone [3]
1919, July 18	2¢ per oz. [4]
1918, Dec. 15	6¢ per oz.
1918, July 15	16¢ per oz. and 6¢ each additional oz., of which 10¢ was for special delivery
1918, May 15	24¢ per oz., of which 10¢ was for special delivery

[1] Airmail postal and post card service started Jan. 1, 1949.
[2] Prior to 1948, weight and size limits for airmail were the same as for first-class mail; beginning Sept. 1, 1948, matter carried by air weighing 8 oz. or less was classified as "airmail," and over 8 oz. as "air-parcel post."
[3] Zones were (1) New York-Chicago, (2) Chicago-Cheyenne, (3) Cheyenne-San Francisco.
[4] Not strictly an "airmail rate." Between July 18, 1919, and July 1, 1924, there was no airmail rate and no offer of airmail service. Some mail, however, was carried by planes at the regular first-class rate of 2¢ per oz.

NA Not available.

[1] 1880–1919, includes pamphlets; 1920–1928, pamphlets included in total only; thereafter, pamphlets excluded entirely.

[2] Beginning 1967, counting methods were revised; prior years not strictly comparable with subsequent years. See text.

[3] Beginning 1959, data not strictly comparable with previous years because of change in definition of "book." See text.

[4] Prior to 1961, includes military.

[5] Agrees with source; however, figures for components do not add to total shown.

* Denotes first year for which figures include Alaska and Hawaii.

[1] Apparent consumption; equals production plus imports minus exports adjusted for year-end changes in newspaper publishers, inventories, and domestic mill stocks.

[2] Based on information of Media Records, Inc. Through 1968, newspaper pages per issue based on average in 39 cities; thereafter, on average in 110 cities.

Series R 244–257. Newspapers and Periodicals—Number and Circulation: 1850 to 1967

[**Circulation in thousands.** Data for 1947 and 1954 are for establishments having 1 or more regularly paid employees for whom a social security account was maintained at the Bureau of Old-Age and Survivors Insurance. Data for 1921–1939 are for establishments reporting annual receipts of $5,000 or more. For prior years the corresponding limit was $500. Circulation figures are the totals of average circulation per issue]

NA Not available.

[1] Data are estimates based on the yearly subscription rate of reporting newspapers, as many small newspapers did not report circulation.

[2] Does not include circulation of "Other" newspapers (series R 253), not available prior to 1925.

[3] Does not include a number of "Other" newspapers (series R 252), not available prior to 1919.

[4] Includes a small number of periodicals.

Chapter S

Energy

S 1–218. General note.

Energy to meet the expanding power needs of our economy has been secured from various animate and inanimate sources. Among those of historical significance, whose use is generally within the control of mankind, are human and animal power; waterpower; windpower; wood and other vegetable matter used as fuel; coal; oil; and natural gas; and, since 1957, atomic energy. Currently, efforts are being made to develop and control solar energy, internal heat of the earth, and, through chemical processing, certain additional natural resources such as shale and sea water. For those interested in developing a comprehensive understanding of power problems the following books are suggested: Eugene Ayers and Charles A. Scarlott, *Energy Sources—The Wealth of the World*, McGraw-Hill Publishing Company, Inc., New York, 1952; P. C. Putnam, *Energy in the Future*, D. Van Nostrand Company, Inc., New York, 1953; Fred Cottrell, *Energy and Society*, McGraw-Hill Publishing Company, Inc., New York, 1955; J. F. Dewhurst and Associates, *America's Needs and Resources, A New Survey*, The Twentieth Century Fund, New York, 1955; Ali Bulet Cambel, editor, *Energy R&D and National Progress*, Government Printing Office, 1964; Hans H. Landsberg and Sam H. Schurr, *Energy in the United States, Sources, Uses, and Policy Issues*, Random House, New York, 1968; Warren E. Morrison and Charles L. Readling, *Energy Model for the United States, Energy Balances for the Years 1947–1965, and Projections and Forecasts*, U.S. Bureau of Mines Information Circular 8384, 1968; N. B. Guyol, *The World Electric Power Industry*, University of California Press, Berkeley and Los Angeles, 1969; M. King Hubbert, "Energy Resources," in *Resources and Man*, W. H. Freeman and Co., San Francisco, 1969; U.S. Congress, Joint Committee on Atomic Energy, *Environmental Effects of Producing Electric Power*, selected materials and hearings issued in 4 vols., 1969 and 1970; U.S. Senate, Committee on the Judiciary, hearings of the Subcommittee on Anti-Trust & Monopoly, *Competitive Aspects of the Energy Industry*, parts 1 and 2, 1970; U.S. Bureau of the Census, *1967 Census of Manufactures—Fuels and Electric Energy Consumed*, Report MC 67(S)4, Government Printing Office, 1971; Joel Darmstadter with Perry D. Teitelbaum and J. G. Polach, for Resources for the Future, Inc., *Energy in the World Economy: A Statistical Review of Trends in Output, Trade, and Consumption Since 1925*, Johns Hopkins University Press, Baltimore, 1971; National Petroleum Council, *U.S. Energy Outlook—An Initial Appraisal (1971–1985)*, Washington, D.C., 1971; Resources for the Future, Inc., in cooperation with M.I.T. Environmental Laboratory, *Energy Research Needs*, a report to the National Science Foundation, document No. PB 207–516, National Technical Information Service, Springfield, Va., 1971; U.S. Federal Power Commission, *The 1970 National Power Survey*, issued in 4 parts, 1971 and 1972; Walter G. Dupree, Jr., and James A. West, *United States Energy Through the Year 2000*, U.S. Dept. of the Interior, 1972; Edison Electric Institute, *Statistical Yearbook of the Electric Utility Industry*, New York, annual; U.S. Federal Power Commission, *World Power Data*, annual; U.S. Bureau of Mines, *Minerals Yearbook*, vols. I–II combined, *Metals, Minerals, and Fuels*, annual; United Nations Statistical Office, *World Energy Supplies*, Statistical Papers, Series J, New York, annual; U.S. Senate Committee on Interior and Insular Affairs, *A National Fuels and Energy Policy Study*, Pursuant to Senate Resolution 45, 1972–1974; Federal Power Commission, *Natural Gas Survey*, forthcoming.

Preparation of historical tables showing energy from various sources and total energy input on a per capita or other basis is complicated. The amounts shown will differ greatly depending on the basis and point of measurement used. End-use data, for example, will show far larger increases in total per capita over the last 100 years than will data presenting physical measures such as tons, gallons, cubic feet, or B.t.u.'s because of increased efficiency in conversion and utilization.

Data on energy available from mineral fuels, waterpower for electric energy, and fuel wood are shown in series M 76–92. For total waterpower, net imports from waterpower sources in Canada and the energy equivalent of waterpower not converted to electric energy (direct drive from water wheels) must also be considered. Statistics available for power sources not included here are presented in some of the sources cited above. Data on the development and use of energy for power and related purposes are compiled or summarized and published by: Federal agencies such as the Bureau of Mines, Bureau of the Census, Rural Electrification Administration, Bureau of Labor Statistics, Federal Power Commission, Federal Reserve Board, Interstate Commerce Commission; the various trade associations such as the Edison Electric Institute, American Gas Association, Bituminous Coal Institute, American Petroleum Institute; and various technical journals, particularly in their statistical issues.

S 1–14. Total horsepower of all prime movers, 1849–1970.

Source: 1849–1952, J. F. Dewhurst and Associates, *America's Needs and Resources, A New Survey*, © 1955 by The Twentieth Century Fund, New York, p. 1117; 1955, estimates prepared by John A. Waring for *Transactions of Canadian Sectional Meeting, World Power Conference, 1958;* 1960–1970, unpublished estimates from John A. Waring.

Data for 1849–1952 for series S 4 (work animals), S 10 (sailing vessels), and S 12 (windmills), as shown on p. 1117 of *America's Needs and Resources*, are based on data presented in appendix 25-3 of that volume. All other data for 1849–1919 are from C. R. Daugherty, A. H. Horton, and R. W. Davenport, *Power Capacity and Production in the United States*, Water Supply Paper No. 579, U.S. Geological Survey, 1928. The original data from Daugherty *et al.* were for 1849 and subsequent 10-year intervals through 1919. Estimates for 1850 and subsequent 10-year intervals through 1940 are based on straight-line interpolation of original data.

All data for 1929, 1939, 1950, and 1952 shown in Dewhurst were prepared by John A. Waring. According to Waring, estimates for 1952 as shown in Dewhurst are too low for mines and farms, and too high for railroad locomotives.

A technical and statistical bibliography of early data pertaining to the development of horsepower equipment in the United States appears on pp. 43 and 44 of Daugherty *et al.* This source also contains a section on the sources and accuracy of the data. The following appraisal of the data appears on p. 21: "In general the accuracy of the statistics presented . . . increases with each successive decade. The data for the early years are almost wholly estimated, but it is believed that the estimates are supported by bases accurate enough to lend a degree of authenticity to them."

In addition to the classifications shown in series S 1–14, the installed mechanical horsepower in a number of special industries was also calculated for 1960 by Waring, as follows (in thousands): Municipal waterworks pumping engines, 2,188; gas utility stations, 1,775; natural gas pipeline pumping stations, 6,110; underground gas storage pool compressor engines, 470; petroleum pipeline pumping stations, 4,560; standby communications generator sets, 632; isolated nonindustrial generator sets, 5,204; construction and contractors' building

equipment, 89,182; inboard powered motor boats and yachts, 29,870; outboard powered motor boats, 60,500; portable chain saws, 2,020; and power lawn mowers, 36,800. These total 239,311 thousand horsepower, which, when added to the 1960 total of 11,007,889 thousand shown in series S 1, result in an aggregate of 11,247,200 thousand horsepower.

S 15–24. Consumption of raw materials in constant 1967 dollars, by broad use classes, 1900–1969.

Source: U.S. Bureau of the Census and U.S. Bureau of Mines, *Raw Materials in the United States Economy: 1900–1969* (Working Paper No. 35), table A5.

The raw-materials series presented in the source are regrouped in these series in terms of the major purposes for which the materials are used. This classification represents materials used in the entire U.S. economy, including the raw-materials industries.

Minerals usually used for energy purposes are increasingly being absorbed for nonfuel uses. Some such uses are for synthetic rubber, carbon black, and other chemical raw materials; for lubricants, asphalt, road oil, waxes; and as carbon in iron and electrodes. The approximate significance of such uses is indicated by the following figures:

Period	*Mineral fuels used for nonfuel purposes as a percent of total mineral fuels use*
1960–1969	6.7
1950–1959	5.0
1940–1949	4.2
1930–1939	3.3
1920–1929	2.6
1910–1919	1.4
1900–1909	1.2

The figures in series S 15–24 exclude such uses from the figures presented for "energy materials" and include them in "physical-structure materials."

It should be noted that the relative importance of the foods, energy materials, and physical-structure materials segments of the consumption pattern is somewhat influenced by the consumption of raw materials within the raw-materials industries. The value of purchased feed for farm animals and seed are excluded here. However, the mineral fuels consumed in producing raw materials are included, as well as the indirect consumption of raw materials represented by the capital-goods requirements of the raw-materials industries. Available staff facilities did not permit extensive analysis of the magnitude of consumption of raw materials within the raw-materials industries. It appears, however, that 4 to 7 percent of all energy has been used in mineral-fuel production.

See also series K 392–406, L 56–71, and M 38–53 for raw material consumption by agricultural materials, forest products, and minerals, respectively.

S 25–31. Consumption of fuel resources, by major consumer group, 1947–1970.

Source: U.S. Bureau of Mines, *Minerals Yearbook* and *Mineral Industry Surveys*, annual issues.

Most of the uses in the residential and commercial classification have the common characteristic of contributing personal comfort: Lighting, heating, and cooling in homes, schools, theaters, offices, and stores; and the operation of dozens of other appliances from kitchen stoves to office equipment. The line between the two is particularly thin in the case of large apartment houses, which, for the purpose of most energy statistics, are classified as commercial. Industry comprises manufacturing and mining. The transportation category takes in both private vehicles operated by their owners and public transportation—long distance as well as short haul, passenger as well as freight, and water and air as well as land.

Miscellaneous is a "catch-all" category embracing such diverse uses and users as street lighting, the defense establishment, construction activities, transportation activities other than those identifiable in published statistics, and agriculture, which includes all uses of energy in farming, etc.

S 32–175. General note.

Some data on the production and use of electric energy are available since the beginning of commercial production in 1882. Data for 1882–1920, however, are difficult to evaluate because of changing bases of measurement and variations in coverage of the various censuses or other surveys made during the period. The Bureau of the Census published the results of censuses of the electric light and power industries made at 5-year intervals for 1902–1937, and the reports of the census of manufactures and of mineral industries contain important data on industrial use and production of electric energy. The Geological Survey, the *Electrical World* (McGraw-Hill Publishing Company, Inc., New York), and the National Electric Light Association also published considerable data applicable to the industry during this early period.

The chief gaps in the data for these years are in the production of electric energy by industrial establishments for their own use, and in the measurement of the sales by electric railroads and railways for public distribution. Early data on capacity must be converted from horsepower (hp.) to kilowatts (kw.) to be comparable; and capacity data in kilovolt-amperes (kv.-a.) were often tabulated as kw. without adjustment for the power factor. Data on generation were also often reported without allowance for the kilowatt-hours (kw.-hr.) used in production and, in many instances, where the prime mover was used both for direct drive and for electric generation, the kw.-hr. equivalent of power used directly was reported as generation. End uses were reported by appliances, as number of lamps, arc lights, or motors, rather than as kw.-hr. These variations in units of measurements, in classification, and in coverage often resulted in differences in estimated totals of as much as 20 to 25 percent. In presenting historical data on electric energy since 1902, efforts have been made to resolve such differences and place the data on a comparable basis.

Referring to various historical sources, one will note that data published in later years will frequently show material revisions to reflect changes in classification and coverage. In the utility series prior to 1945, for example, when a large generating plant was purchased from an industrial concern, the utility series would be adjusted to include the capacity and generation of this plant in prior years. Where such revisions have been made, the revised data are shown.

Since 1920, comprehensive statistics on capacity and generation of electric utilities for public use have been compiled and published by the Geological Survey for 1920–1936, and by the Federal Power Commission since 1936. Data on capacity and generation by nonutility establishments since 1939 have been compiled and published by the FPC. The Commission also published financial, operating, sales, and rate statistics for the electric utility industry. Data on customers, revenues, sales, and related matters since 1926 are published by the Edison Electric Institute and the McGraw-Hill Publishing Co., Inc., *Electrical World.*

During the years there has been a marked growth in the application of power from various fuels through electric energy produced not only in generating plants but by generators in mobile equipment of many types. Among these are power plants in ships, railroad locomotives, trailers, barges, trucks, tractors, buses, and in machines used in mining and heavy construction which produce electric energy for driving and operating the mobile unit and for other services related thereto, or to supplement generating plants for temporary periods. Also of interest are the electric generators for auxiliary purposes operated directly or indirectly by the prime movers in automobiles, airplanes, and other mobile engines or by independent power units in refrigerator cars and trailers and many other installations to furnish electric energy directly or to maintain the electric charge in batteries for use as required. The importance of these small generators is indicated by the fact that the 108 million motor vehicles registered

in the United States in 1970 alone have a total generator capacity in excess of that of all the federally owned electric utilities. Except where large units in the general classification of mobile plants are connected to utility systems for power for extended periods, neither capacity nor generation are included in the data indicating production and use of electric energy in the United States. In some cases, however, industries will report the horsepower of such equipment as driving generators, but, in general, do not indicate power output in kw.-hr.

S 32–35. Net production of electric energy, by electric utility and industrial generating plants, by type of plant, 1902–1970.

Source: Summation of series S 36–43.

S 36–39. Net production of electric energy, by electric utility generating plants, by type of plant, 1902–1970.

Source: 1902–1917, U.S. Bureau of the Census, *Census of Electrical Industries: Central Electric Light and Power Stations;* 1920–1970, U.S. Federal Power Commission, *Production of Energy and Capacity of Plants,* monthly and annual reports.

Census data for 1902–1917 were adjusted in some instances for classification and coverage by the late L. D. Jennings of the Federal Power Commission. The figures for electric energy produced by waterpower for 1912 and 1917, for example, differ from those published in *Central Electric Light and Power Stations: 1917,* table 26, because they have been adjusted to exclude electricity produced by steam and internal combustion engines at plants which also produced energy by waterpower, and energy produced in plants subsequently included in series S 40–43.

For 1920–1970, data are based on monthly reports by electric utilities to the FPC. Coverage is substantially 100 percent. Included are plants of the privately owned electric utilities, the cooperatively owned systems, and the publicly owned electric utilities. The latter group is composed of the following classes: Municipal electric utilities, Federal projects, public utility power districts, and State power projects.

S 40–43. Net production of electric energy, by industrial generating plants, by type of plant, 1902–1970.

Source: U.S. Federal Power Commission, 1902–1941, unpublished data; 1942–1970, *Production of Energy and Capacity of Plants,* monthly and annual reports.

Data include the generation of electric energy by manufacturing and extracting industries and by electric railroads and railways, but exclude electric energy generated by the following sources: Nonutility generating plants of less than 100 kw. capacity; plants operated by hotels, apartment houses, office buildings, or other commercial, transport, or service establishments; and plants in military installations. The total generating plant generation excluded is estimated at about 1½ percent of the annual total shown for both utility and industrial plants. This percentage has declined in recent years with the development of mobile type generators.

S 44–52. Net production of electric energy, by class of ownership, 1902–1970.

Source: **Series S 44–51,** see source for series S 36–39; **series S 52,** see source for series S 40–43.

The Federal Power Commission reports cited above show data for "noncentral stations" within the publicly owned group for 1920–1951. This category included plants supplying electric power primarily for such functions as public street lighting, water pumping, and sewage disposal. Such plants were included in municipal or other named classifications effective 1952. A similar adjustment using records available was made for 1920–1951.

Data for cooperatively owned utilities (series S 47) are shown in the source combined with power districts and State projects. The separate data for series S 47 were obtained from the detailed records of the FPC. These amounts are slightly below those reported by the Rural Electrification Administration, *Annual Statistical Report—Rural Electrification Borrowers,* because a few plants financed by the REA are included in other classifications or are not, for various reasons, included in the FPC totals.

S 53–57. Number of electric utility generating plants, and production per kilowatt of installed generating capacity, 1902–1970.

Source: See source for series S 36–39.

Figures for series S 57 are based on beginning- and end-of-year average installed generating capacity, except for 1902–1920 when capacity as of the end of the year was used.

In counting the number of generating plants, each prime mover type in combination plants was included separately. Generating capacity represents the manufacturer's maximum nameplate rating of generators.

S 58–73. Privately owned electric utility generating plants, by type of plant and plant size, 1920–1970.

Source: U.S. Federal Power Commission, *Statistics of Privately Owned Electric Utilities in the U.S.,* annual issues.

See text for series S 36–39.

S 74–85. General note.

Gas turbine (plant type) generating capacity is included with steam. Separate data for gas turbines are available from the Federal Power Commission beginning with 1969. Amounts for 1969 and 1970 are as follows (in thousands of kilowatts):

	Electric utilities	*Industrial establishments*
1970	15,460	441
1969	10,094	424

S 74–77. Installed generating capacity in electric utility and industrial generating plants, by type of plant, 1902–1970.

S 95–106. Consumption of fuels by electric utilities, 1920–1970.

Source: U.S. Federal Power Commission, *Fuel Consumption of Electric Power Plants,* monthly and annual reports, and unpublished data.

For series S 105–106, data for years prior to 1940 are from the records of the Federal Power Commission or may be computed from the data shown for fuel used and electric energy generated. For 1920–1938, the distribution of energy generated for plants using two or more kinds of fuel was estimated.

The data are based on individual generating plant reports submitted monthly by all electric utilities to the FPC. Both the pri-

vately owned and publicly owned operations are included. The coal figures include anthracite, bituminous, and lignite coal—processed separately for the detailed report—and small amounts of coke; those for oil include crude oil, fuel oil, distillate pitch, sludge, and small quantities of other liquid fuels. The consumption of gas includes both natural gas and byproduct manufactured gas. In general, the minor fuels are reported in units equivalent to those for the major class of fuel with which they are combined. The quantities of each fuel include the consumption of generating plants operating on a standby or other intermittent basis.

Data on fuels used in industrial electric generating plants are not solicited as many establishments do not keep such records separate from fuels used for other purposes.

Kilowatt-hour production represents the summation of net station output after deduction for energy used in the operation of auxiliary equipment and facilities within the generating plants. Where two or more kinds of fuel are used at a particular plant during the same month, allocation of the kilowatt-hour production to each fuel is reported. Where such allocations are not made by the reporting utility, they are estimated on the basis of the latest available annual average B.t.u. content of each fuel used at that plant and the average B.t.u. per kw.-hr. generated reported for each kind of fuel.

S 107. Overall heat rate, 1925–1970.

Source: Edison Electric Institute, *Statistical Year Book of the Electric Utility Industry*, annual issues.

These data are estimates computed by the Edison Electric Institute by the application of an appropriate calorific factor for each fuel in series S 104–106.

S 108. Annual use of electric energy per residential customer, 1912–1970.

Source: 1912, U.S. Bureau of the Census, *Census of Electrical Industries, 1912;* 1917–1925, National Electric Light Association, *Statistical Supplement to the Electric Light and Power Industry in the United States*, Publication 1106, New York, 1931, p. 27; 1926–1970, Edison Electric Institute, *Edison Electric Institute Statistical Bulletin*, New York, 1952 and 1970 issues.

Averages are based on data for customers and on use reported by the electric utilities. Data for appliances used and related matters are published annually in the statistical issue of *Electrical Merchandising* (McGraw-Hill Publishing Company, Inc., New York).

S 109–111. Percentage of dwelling units with electric service, 1907–1956.

Source: For census years, U.S. Bureau of the Census, census of housing (decennial) and census of agriculture (quinquennial); for intercensal years, various annual issues of the following: National Electric Light Association, *Statistical Supplement to the Electric Light and Power Industry in the United States*, New York; McGraw-Hill Publishing Company, Inc., *Electrical World*, New York (copyright); and Edison Electric Institute, *Edison Electric Institute Statistical Bulletin*, New York.

Some adjustments for comparability and coverage have been made in the source data by the late L. D. Jennings of the Federal Power Commission.

In the annual *Statistical Bulletin* of the Edison Electric Institute and in the statistical reports of their predecessor organization, the National Electric Light Association (cited above), data on the electrification of farms (series S 110) are presented. The information shown in these publications includes Bureau of the Census data and data compiled by the Rural Electrification Administration as well as material collected by the Institute or the Association. In the annual statistical numbers of the *Electrical World* (cited above), data are presented showing the percent of the population living in wired homes (series S 109). These percentages are generally based on the relation between the number of residential electric customers and population in census years. Percentages presented by the different sources indicated may vary from one to the other for intercensal years, depending on the statistical procedures used to determine the number of farms and dwelling units and related concepts applied. Among the items causing variations in the percentages of farms electrified, for example, are the inclusion or exclusion of farms without permanent dwelling units, farms with their own electric power plants, farms without service where distribution lines are within ¼ mile of the dwelling unit, or interpolation for the number of farms in intervening years between the various censuses of agriculture. The percentages shown are those considered reasonable and comparable to those for census years.

S 112–115, and S 117. Average price of electricity by class of service, 1907–1970.

Source: 1907–1924, based on a study by W. G. Vincent, Pacific Gas and Electric Company, *Edison Electric Institute Bulletin*, June 1936, p. 224 (adjusted by the late L. D. Jennings for comparability with the Federal Power Commission series); Federal Power Commission, 1925–1934, annual report, *Typical Electric Bills: Cities of 50,000 Population and More* (except that average prices have been adjusted from as of October 1, as originally published, to as of January 1 for comparability with the series subsequent to 1934); 1935–1970, *Typical Electric Bills, 1964*, p. VI and *1970*, p. IX.

Prior to 1935 for series S 113–115 and for all years for S 112, the average bills for specified consumption are based on typical bills for residential and industrial service in cities with 50,000 or more inhabitants. These cities include about one-third of the total U.S. population. Beginning 1935 for series S 113–115, typical bills are based on residential service in communities with 2,500 or more population. These communities include about two-thirds of the U.S. population. Commercial and industrial service is still based on service in cities of 50,000 or more inhabitants. Since populations in adjacent areas are frequently served under the rate schedules effective in these cities, the bills reported indicate rate levels applicable to more than 70 percent of the total population.

Specifications for the computation of typical net monthly bills are prepared by the Federal Power Commission. Special rates for refrigeration, cooking, or water heating, where generally applicable, are used in computing the bill. Fuel adjustments, commodity adjustments, and tax adjustments where the tax is imposed upon the utility and not upon the customer, and other similar adjustments, have been included in the computations where applicable. Sales taxes computed separately and added to the bill computed under the rate schedules are not included in the bills reported.

Average bills are determined by multiplying the bill as of January 1 for each city by its population and dividing the sum of these products by the sum of the populations. Where two or more utilities serve a community with different bills, the population for each bill is determined by the proportion of customers served by class of service. For service where bills are presented under more than one rate schedule, the lowest bill generally applicable is used.

S 116, S 118, and S 119. Average price of electricity for all users, by class of user, 1902–1970.

Source: 1902–1925, U.S. Bureau of the Census, *Census of Electrical Industries*, 1917 and 1922 reports; 1926–1970, Edison Electric Institute, *Edison Electric Institute Statistical Bulletin*, New York, 1952 and 1970 issues.

These averages indicate the average revenue from electric service and will vary with average use and rate levels.

S 120. Electric energy, total use, 1902–1970.

Source: Prior to 1955, summation of series S 121–132; thereafter, summation of series S 121–131.

Total amount is equal to (*a*) utility sales of electric energy by class of service, plus (*b*) industrial generation minus sales to utilities, plus

(*c*) use by utilities except in connection with the operation of generating plants, plus (*d*) energy furnished others without charge, plus (*e*) reported losses and unaccounted for, plus (*f*) estimated production for nonutility generating plants not included in industrial generation, series S 40, minus sales to utilities as shown by utility reports on purchased energy. This total by years was compared with total net generation of utility and industrial plants, series S 32, plus net imports, series S 132, plus estimates of energy produced by generating plants not included in series S 32. Differences of significance were analyzed, sources checked, explanations of the differences considered and adjustments made as necessary to account for all production or use. For 1939–1970, an appreciable portion of the energy estimated for plants not included in series S 32 and related series are variously reported to the Federal Power Commission or available from related material. For prior years, the amount estimated is based on relationships in benchmark years for which census or comparable type data on capacity, production, or use were available.

Beginning 1955, series is more refined, reflecting ultimate use rather than being based on rate classifications. Included is self-generation at Atomic Energy Commission installations; excluded is self-generation at shopping centers, apartment buildings, and offices.

Imports are classified according to ultimate use; "net imports" as a category is not included.

S 121–122. Electric energy, residential and commercial use, 1912–1970.

Source: 1912–1925, based on McGraw-Hill Publishing Company, Inc., *Electrical World*, annual statistical numbers, New York (copyright), and U.S. Bureau of the Census, *Census of Electrical Industries*, 1902–1927, reports at 5-year intervals; 1926–1944, Edison Electric Institute, *Electric Light and Power Industry in the United States*, New York; 1945–1970, U.S. Federal Power Commission, *Sales of Electric Energy by Class of Service*, monthly reports.

For 1912–1945, some combinations and adjustments were necessary for comparability with data for later years. These adjustments were made by the late L. D. Jennings of the Federal Power Commission.

Series S 121 includes residential use on farms and in rural areas but does not include (*a*) residential service charged in the rent of dwelling units, (*b*) service where energy is submetered by large apartment houses or operators of housing projects, (*c*) residential service secured in connection with commercial or other enterprises purchasing energy usually under commercial service classifications, or (*d*) irrigation sometimes included in the sales classification "Rural (district rural rates)." The FPC data include some residential service rendered by industrial and certain classes of publicly owned plants excluded from the Edison Electric Institute series.

Series S 122 includes purchases under commercial rate schedules for residential services by operators of apartment houses or housing projects where electric service is included in the rent of the facilities, and submetered service to small industrial establishments. Generally excluded are sales to very large commercial enterprises included in series S 130.

S 123. Electric energy, total industrial use, 1912–1970.

Source: Prior to 1963, summation of series S 124 and S 129; thereafter, see source for series S 121–122.

S 124. Use of electric energy for manufacturing industries, 1912–1962.

Source: 1912–1938, based on data in units of horsepower or kilowatt-hours presented in U.S. Bureau of the Census reports of the census of manufactures; 1939–1962, based on reports of the census of manufactures and U.S. Federal Power Commission report, *Industrial Electric Power, 1939–1946*, and unpublished data.

Estimates or reported data were checked with information on industrial or large light and power sales of electric energy plus data available or developed for industrial generation with allowances for data applicable to series S 129, and, to a limited extent, series S 130. Adjustments that appeared reasonable in view of all information available, including that for later years, were made by the late L. D. Jennings of the Federal Power Commission for changes or variations in classification and coverage.

S 125. Use of electric energy for manufacture of nuclear fuels and related products, 1943–1970.

Source: 1943, U.S. Atomic Energy Commission, unpublished data; 1944-1970, U.S. Federal Power Commission, unpublished data.

Data for 1955–1970 were reported by suppliers of major installations of the Atomic Energy Commission and by the Commission itself.

S 126. Use of electric energy for paper and chemical industries, 1912–1954.

Source: See source for series S 124.

The figures combine data for two major industry groups—paper and chemicals; they exclude major nuclear energy projects where included in the chemical industry group.

S 127. Use of electric energy for primary metals, 1912–1962.

Source: See source for series S 124.

Figures include ferrous and nonferrous metals.

S 128. Use of electric energy for other manufacturing industries, 1912–1962.

Source: See source for series S 124.

S 129. Use of electric energy for extracting industries, 1912–1962.

Source: U.S. Bureau of the Census, 1912–1939, based on *Census of Mineral Industries*, reports for 1919, 1929, and 1939; U.S. Federal Power Commission, 1940–1946, *Industrial Electric Power, 1939–1946;* 1947–1962, unpublished data.

Data for 1947–1962 are based on generation reported by industrial plants in this classification. Data from trade associations and from technical publications on total output and on electric energy per unit computed for intercensal years for representative establishments were used to check data estimated for these years by other methods.

S 130. Use of electric energy for miscellaneous light and power, 1912–1970.

Source: See source for series S 121–122.

Figures include uses variously classified as other, industrial or large light and power (but not included in manufacturing or mineral industries), street and highway lighting, other sales to public authorities where service is not rendered under commercial or industrial rate schedules or purchased for resale by publicly owned systems, railroads and railways, interdepartmental or company use or furnished without charge by electric power systems, rural or other sales for irrigation, and generation in generating plants and used by enterprises of various kinds not included in the use classifications shown separately. The figures include energy for certain classes of residential and commercial uses, series S 121–122, as noted for those series, and may also include some manufacturing and extracting plants for which data were not included in these series, S 124–129, for reasons indicated in text for series S 120.

S 131. Electric energy losses and use unaccounted for, 1912–1970.

Source: 1912–1936, Edison Electric Institute, *Edison Electric Institute Statistical Bulletin*, New York, monthly and annual issues, and *Electric Light and Power Industry in the United States*, annual; McGraw-Hill Publishing Company, Inc., *Electrical World*, annual, New York (copyright); and U.S. Bureau of the Census, *Census of Electrical Industries*, 1912–1932, reports at 5-year intervals. 1937–1970, U.S. Federal Power Commission, unpublished data.

Relation to total energy used varies from year to year with changes in the proportion of energy metered on the low or on the high side of transformers at the point of delivery or at the generating plant, as well as for changes in technological efficiency in the transmission and distribution of electric energy and its relation to the quantities handled.

S 132. Electric energy, net imports, 1912–1970.

Source: U.S. Federal Power Commission, unpublished data.

Data for 1940–1970 are based on annual surveys for staff use. For prior years, data are based on FPC S-15, *Movement of Electric Energy Across State Lines and International Boundaries, 1940*, and on historical records and files to include exports and imports for industrial as well as utility purposes. Monthly and annual *Electric Power Statistics* published by the Dominion Bureau of Statistics, Ottawa, Canada, were also considered. Coverage in reports for the earlier years varied as did the treatment of energy delivered or received on long-term exchange agreements.

Beginning 1955, data classified in ultimate use; "net imports" as a category is not included in total.

S 133–146. Electric utilities—selected balance sheet and income account items of privately owned companies, 1937–1970.

Source: U.S. Federal Power Commission, *Statistics of Privately Owned Electric Utilities in the United States, 1971*, tables 10 and 13.

S 147–159. Rural Electrification Administration—electric program, summary of operations, 1935–1970.

Source: U.S. Rural Electrification Administration, *Annual Statistical Report—Rural Electrification Borrowers*, various issues.

The Rural Electrification Administration was established in May 1935, to initiate, formulate, administer, and supervise a program of approved projects with respect to the generation, transmission, and distribution of electric energy in rural areas. Later, the Rural Electrification Administration (REA) was authorized to make loans for a maximum of 35 years with interest at 2 percent per annum for the construction or improvement of rural electric systems.

The following definitions are used by REA:

Borrowers. Organizations, mainly cooperatives, to which loans for extending central station electric service in rural areas are made.
Systems. Rural electric distribution, generation, and transmission systems in operation by REA borrowers.
Miles energized. Pole miles of electric distribution and transmission lines in service.
Consumers served. The number of individual customers receiving service by borrowers as of the end of the calendar year.
Energy generated. The kilowatt-hours of energy produced during the calendar year by electric generating plants owned by the borrowers of REA loan funds.
Energy purchased. The kilowatt-hours of energy purchased during the calendar year by REA borrowers from all suppliers.
Revenue. Gross revenue received by REA borrowers mainly from the sale of electric energy.

S 160–175. Developed and undeveloped water power, by geographic division, 1920–1970.

Source: U.S. Federal Power Commission, *Electric Power Statistics*, annual summaries and related monthly reports.

The data for developed water power are based on monthly reports submitted to the Federal Power Commission by the electric utilities. FPC practice is to record generating unit capacity as that given by the manufacturer on the nameplate which is placed on each generator. Included are plants of the privately owned electric utilities, municipal utilities, Federal projects, public utility power districts and State power projects. For 1946–1970, the data also include hydroelectric plants of industrial establishments based on their monthly reports to the FPC.

The data for undeveloped water power resources are based on river basin studies of the years shown. The discovery of new sites, changing criteria, and re-evaluation of needs, as well as the development of sites and a host of other reasons may cause the listed amounts of undeveloped water resources to increase or decrease from year to year. Therefore, the yearly changes in the figures for undeveloped resources cannot be directly related to the amounts of developed water power resources.

S 176–189. Natural gas—consumption and value, 1922–1970.

Source: U.S. Bureau of Mines, *Minerals Yearbook*, annual volumes.

Data on natural-gas consumption and value are collected by annual surveys of oil and gas producers, natural gas processing plants, gas pipeline companies, and gas utility companies with separate reports obtained for each State in which they operate.

Volumes are reported at the pressure base selected by the reporting company; however, prior to 1967, if the reported pressure base deviated more than 5 percent from 14.65 pounds per square in absolute (p.s.i.a.) at 60° F, it was corrected to this base. Beginning 1967, gas volumes are reported or converted to a pressure base of 14.73 (p.s.i.a.).

S 190–204. Gas utility industry—customers, sales, and revenues, by type of service, 1932–1970.

Source: American Gas Association, Arlington, Va., 1932–1959, *Historical Statistics of the Gas Industry*, 1965, pp. 163, 213, and 263; 1960–1970, *Gas Facts, 1971*, pp. 58, 78, and 98. (Copyright.)

American Gas Association (A.G.A.) statistics are based on data provided by individual gas companies to A.G.A.'s department of statistics on the Uniform Statistical Report, a detailed questionnaire distributed annually to the industry. This questionnaire, periodically reviewed by the financial community to insure the inclusion of all items important to security analysis and insurance companies, is also utilized by many gas companies in reporting their operations to the financial community.

Data relating to customers, sales, and revenues are based upon responses submitted to A.G.A. on this questionnaire by gas companies representing 96 percent of the industry. For the small remaining portion of the industry, data have been obtained from reports filed with regulatory commissions, supplemented by investigation of financial publications and other secondary sources.

Revised monthly sales and quarterly customers, sales, and revenues, as well as interim income statements, are based on information previously published in the *Monthly Bulletin of Utility Gas Sales*, and the *Quarterly Report of Gas Industry Operations*.

The three rate classifications are:

1. *Residential service.*
   a. *Without space heating.*
      Service to customers supplied for residential purposes (cooking, water heating, kitchen heating, where another fuel is principal heat for premises, etc.) by individual meter in a single family dwelling or building, or in an individual flat or apartment, or to not over four households served by a single meter (one customer) in a multiple family dwelling, or portion thereof. Service for residential purposes supplied to five or more households served as a *single customer* (one meter) under one rate classification contract is considered as commercial and is counted as only one customer.
      Residential premises also used regularly for professional or business purposes (such as a doctor's office in a home, or where a small store is integral with the living space) are considered as residential where the residential

use is half or more of the total gas volume; otherwise, these are commercial.

Dormitories, hotels, religious and eleemosynary institutions (such as orphan homes), boarding and rooming houses, motor courts, camps, etc., are considered as commercial customers for statistical purposes even though they are supplied by the company on a residential rate contract.

b. *With space heating.*

Service to customers using gas to supply the principal space heating requirements of a dwelling; other residential uses are included if supplied under the same rate classification.

c. *Air conditioning service.*

Service to customers using gas to supply the principal air cooling requirements of a dwelling; other residential uses (cooking, water heating, etc.) are included if supplied under the same rate classification.

2. *Commercial service.*

Service to customers primarily engaged in wholesale or retail trade, agriculture, forestry, fisheries, transportation, communication, sanitary services, finance, insurance, real estate, personal services (clubs, hotels, rooming houses, five or more households served as a single customer, auto repair, etc.), government, and to service that does not directly come in one of the other classifications. The size of the customer or volume of use is not a criterion for determining commercial service. The nature of the customer's primary business or economic activity at the location served determines the customer classification. If a particular load to a manufacturing or processing plant represents the cafeteria of the plant, or a heating load, with or without any processing load, whether or not separately metered, the account is classified as industrial service. Gas supplied to commercial customers for air conditioning or space heating is included under commercial service, whether or not supplied under a separate rate contract.

3. *Industrial service.*

Service to customers engaged primarily in a process which creates or changes raw or unfinished materials into another form or product. This includes establishments in mining and manufacturing. The size of the customer or volume of use is not a criterion for determining industrial service. The nature of the company's primary business or economic activity at the location served determines the classification used. If a manufacturing corporation has only a sales office, *no plant,* at a particular location, the classification commercial service is used on the basis of primary activity. If, however, the sales office is part of a manufacturing plant, the classification is industrial service. Gas supplied to these customers for air conditioning or for space heating is included under industrial service, whether or not supplied under a separate rate contract.

Other services comprise service to municipalities or divisions (agencies) of State or Federal Governments under special contracts or agreements or service classifications, which are applicable only to public authorities using gas for general or institutional purposes. They exclude sales properly included under commercial or industrial service such as manufacturing arsenals or publicly owned power systems.

* Denotes first year for which figures include Alaska and Hawaii.
[1] Includes passenger cars, trucks, buses, and motorcycles.
[2] Excludes electric motors.
[3] Beginning 1965, not strictly comparable with earlier years.
[4] Excludes horses and other work animals, which are included in series S 4.
[5] Includes private planes and commercial airliners.
[6] Windmills included in series S 11.
[7] Beginning 1955, not strictly comparable with earlier years.
[8] Includes Alaska and Hawaii.

Series S 15–24. Consumption of Raw Materials in Constant 1967 Dollars, by Broad Use Classes: 1900 to 1969

[In millions of dollars]

Year	Raw materials, total	Food	Energy materials				Physical-structure materials

[1] Includes bunkers and military transportation.
[2] Represents fossil fuels burned in steam-electric plants with hydropower and nuclear power converted to national average heat rates for fossil-fueled steam-electric plants as reported by Federal Power Commission.
[3] Electricity generated and imported.

Series S 32–43. Net Production of Electric Energy, by Electric Utility and Industrial Generating Plants, by Type of Plant: 1902 to 1970

* Denotes first year for which figures include Alaska and Hawaii.
NA Not available.
[1] Beginning 1950, figures revised to allocate rural service to other appropriate classes of service; not comparable with previous years.
[2] Composite series using population weights and uniform bills for cities having population of 2,500 or more, beginning 1935; prior years, 50,000 or more.
[3] Peak demand of 1,000 kilowatts.

Series S 120–132. Use of Electric Energy: 1902 to 1970

[In millions of kilowatt-hours]

Year	Total [1]	Residential	Commercial	Industrial							Miscellaneous light and power	Losses and use unaccounted for	Net imports [2]

* Denotes first year for which figures include Alaska and Hawaii.

[1] Beginning 1955, represents a more refined series reflecting ultimate use rather than being based on rate classifications. Includes self-generation at Atomic Energy Commission installations; excludes self-generation at shopping centers, apartment buildings, and offices.

[2] Beginning 1955, classified in ultimate use; "net imports" not included in total.

[3] Paper and chemicals included in other.

– Represents zero.
[1] Excludes loans rescinded. Cumulative as of Dec. 31. Prior to 1948, includes amounts not yet under loan contract.
[2] As of Dec. 31. Includes data at time of repayment of loan for borrowers whose loans have been repaid in full.
[3] Excludes energy sales and revenues of power sold by one REA borrower to another, except for 1940–1942, for which such sales and revenues are included.
[4] Includes rural-nonfarm and farm consumers.

Series S 160–175. Developed and Undeveloped Water Power, by Geographic Division: 1920 to 1970

[**In thousands of kilowatts.** As of December 31. For composition of divisions, see text for series A 172–194]

									1920	3,704	291	662	629	589	174	487	872

* Denotes first year for which figures include Alaska and Hawaii.
NA Not available.

[1] Nameplate capacity of existing installations only. Includes capacity at electric utility and industrial plants, but excludes pumped storage capacity. Prior to 1946, includes capacity at electric utility plants only.

Series S 176–189. Natural Gas—Consumption and Value: 1922 to 1970

Year	Total consumption [1] (bil. cu. ft.)				Value of gas consumed								Consumers (1,000)

[1] Includes investment and fund accounts, capital stock discount and expense, and reacquired securities.

[2] Includes deferred credits, reserve for deferred income taxes, other reserves, contributions in aid of construction, and retained income.

[3] Liability breakdown will not add to total because of error in reporting units.

Chapter T

Distribution and Services

T 1–491. General note.

Users of these statistics are cautioned to keep in mind that data relate to establishments or firms classified under the Standard Industrial Classification (SIC) System (U.S. Office of Management and Budget, *Standard Industrial Classification Manual*, various issues, Washington, D.C.) as being engaged in wholesale trade, retail trade, or in performing services. As defined in the SIC, services does not include finance, insurance and real estate. Data for such establishments are included in Chapter X.

Where two or more activities are carried on at a single location under a single ownership, all activities are generally grouped together and the entire establishment classified in its major activity. The activities of leased departments are generally combined with the parent establishment in which they are located. Data as presented for the various censuses and annual data do not include the activities engaged in at administrative offices or in auxiliary establishments. Neither do they include the operations of chain store warehouses.

T 1–14. National income originating in distribution and selected service industries, 1869–1970.

Source: 1869–1929, Harold Barger, "Income Originating in Trade, 1869–1929," *Studies in Income and Wealth*, vol. 24, Conference on Research in Income and Wealth, National Bureau of Economic Research, Princeton. U.S. Bureau of Economic Analysis (formerly Office of Business Economics), 1929–1963, *National Income and Product Accounts of the United States, 1929–1965*, table 1.12; 1964–1967, *U.S. National Income and Product Accounts, 1964–67*, table 1.12; 1968–1970, *Survey of Current Business*, July 1972, table 1.12.

Data for 1929–1948 are based on the 1942 Standard Industrial Classification System (SIC); data for 1948–1970 are based on the 1957 SIC System. For all series, data for 1948 are shown according to both systems. See reference in general note for series T 1–491.

T 15–28. Persons engaged in distribution and selected service industries, 1869–1970.

Source: 1869–1919, see source for series T 1–14; 1929–1970, see sources for series T 1–14, table 6.6.

These figures are in terms of full-time equivalent employment, which measures man-years of full-time employment and its equivalent work performed by part-time workers. Full-time employment is defined simply in terms of the number of hours which is customary at a particular time and place. For a full explanation of the concept, see U.S. Office of Business Economics, *Survey of Current Business*, June 1945, pp. 17 and 18.

Unpaid family workers are excluded due to unresolved difficulties in their definition and measurement.

For explanation of the two series presented for 1948, see the text for series T 1–14.

T 29–42. Average annual earnings per full-time employee in distribution and selected service industries, 1929–1970.

Source: U.S. Bureau of Economic Analysis (formerly Office of Business Economics), 1929–1963, *The National Income and Product Accounts of the United States, 1929–1965*, table 6.5; 1964–1967, *U.S. National Income and Product Accounts, 1964–67*, table 6.5; 1968–1970, *Survey of Current Business*, July 1972, table 6.5.

For definition of full-time employment, see text for series T 15–28.

Average annual earnings per full-time employee measures wage-and-salary income per man-year of full-time work. Wages and salaries comprise all payments accruing to persons in an employee status as compensation for their work. They include commissions, tips, and bonuses, as well as cash payments commonly referred to as wages and salaries, together with the value of those payments in kind that clearly represent an addition to the recipient's income. Income in kind is valued, so far as possible, at its cost to the employer. Service industries in which it is a perceptible portion of wages and salaries include hotels and other lodging places and educational services.

Series T 29–42 do not include dismissal pay, directors' fees, employer contributions to social insurance funds and private pension plans, nor accident compensation payments.

For further details, see *Survey of Current Business*, June 1945, pp. 17 and 18.

T 43–57. Distribution and selected services, legal form of organization, 1935–1967.

Source: U.S. Bureau of the Census. 1935, *U.S. Census of Business: 1935, Wholesale Distribution*, vol. 1, p. 119. 1939, *Sixteenth Census of the U.S.: 1940, Census of Business: 1939*, vol. I, p. 71; vol. II, p. 200; and vol. III, p. 104. 1948, *U.S. Census of Business: 1948*, vol. I, p. 6.05; vol. IV, p. 5.02; and vol. VI, p. 5.02. 1954, *U.S. Census of Business: 1954*, vol. I, p. 5–2; vol. III, p. 7–2; and vol. V, p. 5–2. 1958, *U.S. Census of Business: 1958*, vol. I, p. 5–2; vol. III, p. 5–2; and vol. V, p. 5–2. 1963, *1963 Census of Business*, vol. I, p. 5–1; vol. IV, p. 7–1; and vol. VI, p. 5–1. 1967, *1967 Census of Business*, BC67–RS5, p. 5–103; BC67–WS8, p. 8–126; and BC67–SS8, p. 8–57.

Each establishment included in the censuses of business was classified into one of the following legal forms of organization: (1) *Individual proprietorship*—an establishment owned by one person, who may or may not actively participate in the operation of the business. (2) *Partnership*—an establishment owned by two or more persons each of whom has a financial interest in and responsibility for the business. Any partner may or may not actively participate in the operation of the business. (3) *Corporation*—an establishment (other than a cooperative) owned by an organization or company legally incorporated under State laws. In the 1939 and 1948 censuses of business, cooperative associations incorporated under either regular corporation laws or under the special cooperative association laws of the States were classified as corporations. Beginning with the 1954 Census of Business, a separate legal form was established for cooperatives. (4) *Cooperative*—an establishment owned by an association of customers of the establishment whether or not they are incorporated. In general, the distinguishing features of a cooperative are patronage dividends based on the volume of expenditures by the member, and a limitation of one vote per member regardless of the amount of stock owned. The establishments are open to the public as a rule, but generally are patronized primarily by members of the association operating the business. In the 1939 and 1948 censuses of business, cooperatives were defined as either "corporations," if the cooperative was incorporated, or as "other legal forms." (5) *Other legal forms*—These are establishments whose legal form of organization is not one of those defined above. Included in this legal form are liquor stores owned or operated by State, county, or municipal governments, and other miscellaneous ownership types such as estates, receiverships, some nonprofit organizations, and joint ventures. In the 1939 and 1948 censuses of business, cooperatives not incorporated were also included in this category.

T 58–78. Book value of inventories at end of year, 1929–1970.

Source: U.S. Bureau of Economic Analysis (formerly Office of Business Economics). **Series T 58–66:** 1938, unpublished data; 1939–1946, *1969 Business Statistics*, p. 63; 1947–1967, *1971 Business Statistics*, p. 63; 1968–1970, *Survey of Current Business*, December 1971, p. 55. **Series T 67–69:** 1938–1945, *1953 Business Statistics*, p. 16; 1946–1947, unpublished data; 1948–1970, *1971 Business Statistics*, p. 24. **Series T 70–78:** 1929–1952, *1957 Business Statistics*, pp. 17–20 except for series T 70, T 71, and T 75 for 1947–1952, which are revised figures from unpublished data; 1953–1970, *1971 Business Statistics*, pp. 30–33.

In these series, trade inventories are valued at the cost of merchandise on hand; manufacturers' inventories at cost or market price, whichever is lower. About 15 percent of manufacturers' inventories are valued on a last-in-first-out basis; this basis is much less prevalent in trade, although it is used extensively by department stores. Changes in book values reflect changes in unit costs as well as changes in physical quantities.

Retail store inventories, series T 58–66, for 1938–45 were linked to the census of business for 1939 and 1948, the Internal Revenue Service's *Statistics of Income*, and Federal Reserve Board data on department store inventories. Data for 1946–1970 are based on sample information which is used to extrapolate year-end estimates from the 1952–1970 *Annual Retail Trade Reports* of the Bureau of the Census. Adjustments have been made to the data from 1961 forward to make them directly comparable to retail sales estimates derived from a new sample introduced in 1968.

Inventories of merchant wholesalers, series T 67–69, include wholesalers of farm products and raw materials. Figures for 1938–1946 include some types of nonmerchant wholesalers and are not comparable with data for later years. Figures for 1947–1958 are adjusted to the levels of the 1958 Census of Business sample from data based on samples selected from the 1948 and 1954 censuses of business. Figures for 1959 and later years are based on a sample designed to conform to the 1963 Census of Business. Inventories are valued at the cost of merchandise on hand; changes thus reflect changes in unit prices as well as changes in physical quantities.

Manufacturers' inventories for 1929–1946, series T 70, 71, and 75, and inventories by stage of fabrication for 1938–1952, series T 72–74 and T 76–78, are based on a sample of manufacturing companies. The data were collected by the Office of Business Economics and benchmarked to Internal Revenue Service's *Statistics of Income* reports. These data are not directly comparable to the series for later years because of differences in the conceptual basis of the two series, particularly in figures for inventories by stage of fabrication. Total manufacturers' inventories for 1947–1970 and inventories by stage of fabrication for 1953–1970 are based on sample reports collected from manufacturers by the Bureau of the Census and benchmarked to establishment data from its *Annual Survey of Manufactures*, which is benchmarked to the *Census of Manufactures*.

T 79–196. Retail establishments, sales, and persons engaged, by kind of business, 1929–1967.

Source: U.S. Bureau of the Census. 1929, *Fifteenth Census of the United States, 1930, Distribution*, vol. I, *Retail Distribution*, part 1. 1933, *Census of American Business: 1933*, United States Summaries; 1935, *Census of Business: 1935, Retail Distribution*, part 1, vol. I, *U.S. Summary;* 1939, *Sixteenth Census of the United States, 1940, Census of Business*, vol. I, *Retail Trade: 1939*, part 1; 1948, *Census of Business: 1948*, vol. I, *Retail Trade, General Statistics*, part 1; 1954, *Census of Business: 1954*, vol. I, *Retail Trade—Summary Statistics;* 1958, *Census of Business: 1958*, vol. I, *Retail Trade—Summary Statistics;* 1963, *Census of Business: 1963*, vol. I, *Retail Trade—Summary Statistics*, part 1; 1967, *Census of Business: 1967*, vol. I, *Retail Trade—Subject Reports.*

Stores are classified according to their principal kind of business. Where a number of lines are carried, changes in relative importance may serve to shift a particular establishment from one category to another between censuses. Sales figures shown are for kinds of establishments, *not* kinds of products.

Certain of these series have been adjusted or combined for some years prior to 1958, by Professors Charles S. Goodman and Reavis Cox (presently and formerly, respectively) of the Wharton School of Finance and Commerce, University of Pennsylvania, in order to provide historical series that are as comparable as possible. Figures for 1933, in particular, have been adjusted for comparability. The reports of the census of business provide considerably more detail as to kinds of business.

Sales and excise taxes are included in sales figures for 1954 and later years and excluded for 1948 and 1939.

Figures for persons engaged represent the total of the reported number of active proprietors and employees for the week including March 12 for 1967, of active proprietors and employees for the payroll period ended nearest November 15 for 1939–1963, and of active proprietors plus the average annual number of full-time and part-time employees for 1939 and earlier years. Unpaid family workers are excluded from figures for persons engaged.

Establishments without paid employment and with less than $2,500 sales were excluded in 1954 and 1958. The 1948 figures exclude stores which operated the entire year but had sales of less than $500. The corresponding cutoff point for 1939 was $100. Nonemployer establishments which did not operate the entire year were included in 1963 and 1967 if their receipts during the period they operated were at a rate which would have reached an annual total of $2,500 or more had they operated the entire year.

There have been many changes in enumeration methods, in accuracy, and in classifications over the years. The principal ones are noted here; others are described in the various census volumes. Users of the data are cautioned to consult original sources for more complete discussion of factors affecting the comparability of data. The 1954 and subsequent censuses were conducted by mail canvasses of all firms included in the active records of the Internal Revenue Service as subject to the payment of Federal Insurance Contributions Act (FICA) taxes and which were in appropriate kind-of-business classifications. Such data cover only firms with paid employees. The nonemployer segment was derived from a 50-percent sample of 1954, 1958, and 1963 tax returns. This procedure was modified for the 1967 census by the use of tax records instead of census returns for small employers, and the use of tax records for all nonemployers rather than for a 50-percent sample. The 1948 and earlier censuses were conducted by field enumeration. The differences in enumeration affect particularly the coverage of establishments without easily recognized places of business (e.g., nonstore retailers) and those leaving business prior to the end of the year. The data for the 1954 and subsequent censuses thus have better coverage in these areas. The 1933 and 1935 censuses were not taken under mandatory reporting requirements and may be subject to some underenumeration.

Dairies which processed milk and cream were included as retailers in 1948 and earlier years if the major portion of their sales was by route delivery to the homes of consumers. They were excluded in 1954 and later years.

Nonstore retailers are treated as a separate kind of business for 1954 and later years. For earlier years, such retailers (to the extent enumerated) were classified in their appropriate kind of business. For 1954, each leased department is treated as a separate establishment; for all other years, data for such departments were consolidated with the establishments in which they were located.

Two sets of data are shown for 1948. The data for 1948 (comparable with later years) represent retabulations of 1948 data to make them comparable with later years as to treatment of dairies, nonstore retailers, and cutoff points for tabulation. Similarly, two sets of data are shown for the number of persons engaged in retail establishments in 1939. The data for 1939 (comparable with later years) represent the sum of active proprietors and paid employees for the payroll period ended nearest November 15 and are comparable with

data for 1948 and later years. The figures for 1939 (comparable with earlier years) represent the number of active proprietors and the average number of employees for the year, and are comparable with data for 1935 and earlier years.

T 197–219. Retail sales of stores of multiunit retail firms, by kind of business, 1929–1970.

Source: U.S. Bureau of Economic Analysis (formerly Office of Business Economics), 1929–1938, unpublished data; 1939–1970, *1971 Business Statistics*, p. 64, and unpublished data, except 1970 (new basis) and 1960 (old basis) from U.S. Bureau of the Census, *Monthly Retail Trade Report*, January 1961 and December 1971 issues.

For 1929–1951, these series were originally designated as "Retail Sales of Chain Stores and Mail-Order Houses" and represent sales of firms with 4 or more retail stores. Data from the census of business for 1929, 1933, 1935, 1939, and 1948 were used as benchmarks. The intercensal estimates were based on sample groups of organizations with 4 or more stores.

For 1951–1970, the series are based on a sample of firms which operated 11 or more retail units in the most recently available census. Adjustments reflecting changes in industry classification, and in the firms to be included in the sample, were made for 1956 based on 1954 census results; for 1960 based on the 1958 census; for 1964 based on the 1963 census; and for 1970 based on the 1967 census.

Since no adjustments were made for entries and exits from the "11 or more" category between censuses, the data shown cannot be subtracted from total retail sales to obtain sales by organizations operating 10 or fewer stores.

T 220–224. Chains and chain stores, 1872–1928.

Source: U.S. Federal Trade Commission, *Chain Stores: Growth and Development of Chain Stores* (72d Congress, 1st session, Senate Document No. 100), p. 80.

Figures include chains of two or more stores reporting to the Federal Trade Commission or known to that agency. Grocery and meat chains have been combined with grocery chains. Ready-to-wear chains include men's ready-to-wear chains, women's ready-to-wear chains, and men's and women's ready-to-wear chains but not chains specializing in furnishings, accessories, millinery, and the like, nor dry goods chains whether carrying apparel or not. Data for each of the 26 lines of business shown in the total column are found in the source. The source publication also contains estimates of the number of chain outlets in different years but such data embody substantial estimating difficulties.

T 225–244. Retail trade margins, by kind of store, 1869–1947.

Source: Harold Barger, *Distribution's Place in the American Economy Since 1869*, National Bureau of Economic Research, Princeton University Press, 1955, pp. 57, 60, and 81 (copyright).

The retail margin estimates are shown as a percent of retail value of sales, and include both net profit and expenses of doing business. With regard to the reliability of the data, the source volume notes that "because of the extremely heterogeneous nature of the source material, it is not possible to offer any measures of dispersion within categories for the data." The source concludes, however, that we may "have some confidence that at least the larger differences reported . . . have a real existence."

T 245–271. Retail store sales, by kind of business, 1929–1970.

Source: U.S. Bureau of Economic Analysis (formerly Office of Business Economics), 1929–1938, unpublished data; 1939–1946, *1969 Business Statistics*, pp. 58–59; 1947–1967, *1971 Business Statistics*, pp. 58–59; 1968–1970, *Survey of Current Business*, December issues.

Sales figures include multiunit stores. The classification of durable goods stores and nondurable goods stores is based on the durability of the commodities accounting for a major portion of the sales of each kind-of-business group. Data from censuses of retail trade were used as benchmarks for annual 1929–1946 data. Estimates for intercensal years in this period were developed from sales tax collection data, special Internal Revenue Service compilations, business population trends, the Federal Reserve Board index of department store sales, and data from the Bureau of Public Roads and the American Petroleum Institute. Methods of compilation are described in *1969 Business Statistics*, p. 58.

Data for 1946–1961 were based on a new method of estimating retail sales and are not comparable with those shown for prior years. Estimates of retail sales were developed from a sample representing all sizes of stores, firms, or organizations, and all kinds of retail business. These data were not linked to a census of retail trade as were the old, a factor that accounts for most of the difference between the levels of retail sales indicated by the old and new series for 1946. In 1957 the data were revised back to January 1951 to exclude milk dealers engaged in processing on the premises. (This change conforms with the treatment of such establishments as manufacturing plants in the 1954 Census of Business.) Data for 1961–1970 reflect a new sample design and classification changes resulting from the 1963 census. In addition, data by kind-of-business group were revised by shifting all "nonstore" establishments into the general merchandise group. Nonstore establishments (mail order, house-to-house, and vending machine businesses) were previously shown in such kind-of-business groups as food, eating and drinking places, and furniture and appliance. The sampling procedure for the new series is described in *1971 Business Statistics*.

T 272–273. Index of department store sales and stocks, 1919–1970.

Source: Board of Governors of the Federal Reserve System, unpublished data.

The index for sales is based on the average per trading day. The stocks index is the annual average of monthly data of end-of-month stocks.

T 274–371. Wholesale establishments, sales, operating expenses, and persons engaged, by kind of business, 1929–1967.

Source: U.S. Bureau of the Census. 1929, *Fifteenth Census of the United States, 1930, Distribution*, vol. II, *Wholesale Distribution*; 1933, *Census of American Business: 1933*, United States Summaries; 1935, *Census of Business: 1935, Wholesale Distribution*, part 1, vol. I, *U.S Summary*; 1939, *Sixteenth Census of the United States, 1940, Census of Business*, vol. II, *Wholesale Trade: 1939*; 1948, *Census of Business: 1948*, vol. IV, *Wholesale Trade—General Statistics* and *Commodity Line Sales Statistics*; 1954, *Census of Business: 1954*, vol. III, *Wholesale Trade—Summary Statistics*; 1958, *Census of Business: 1958*, vol. III, *Wholesale Trade—Summary Statistics*; 1963, *Census of Business: 1963*, vol. IV, *Wholesale Trade—Summary Statistics*, part 1; 1967, *Census of Business: 1967*, vol. III, *Wholesale Trade—Subject Reports*.

Data shown are for wholesale establishments, other than chain store warehouses. Adjustments have been made in the data prior to 1958 for certain years by Professors Charles S. Goodman and Reavis Cox (presently and formerly, respectively) of the Wharton School of Finance and Commerce, University of Pennsylvania, in order to attain maximum comparability.

Data for persons engaged represent the total of the reported number of active proprietors and employees for the week including March 12, for 1967; of active proprietors and employees for the payroll period nearest November 15, for 1948–1963; and of active proprietors plus the average annual number of full-time and part-time employees for 1939 and earlier years.

There have been numerous changes over the years in the definitions of kinds of business, scope of the census (especially size minimums for enumeration), enumeration methods, and completeness of data. The

statistics shown have been adjusted where possible to maintain maximum comparability over time. Significant changes are noted below. For treatment of lesser differences, see source publications.

The 1954 and later censuses were conducted by mail canvass. Report forms were mailed to all firms included in the active records of the Internal Revenue Service as subject to the payment of Federal Insurance Contributions Act (FICA) taxes and which were classified in appropriate kinds of business or were unclassified at the time the forms were mailed. Data for such censuses, therefore, omit all wholesalers who had no employees subject to FICA taxes. The 1948 and earlier censuses were conducted by field canvasses and were restricted to firms which operated from recognizable places of business, whether or not they had any employees subject to FICA taxes. The 1933 and 1935 censuses were not taken under mandatory reporting requirements and may therefore be subject to some underenumeration.

Data for 1954 and later years are for establishments with paid employees. The original 1948 tabulations include all establishments with sales of $5,000 or more irrespective of employment. For 1939, the corresponding cutoff point was $500. No mention of cutoff point is made in sources of data for years prior to 1939.

The figures for 1948 (comparable with later years) have been revised to reflect 1954 coverage and to incorporate certain changes in classification.

The figures for 1963 (comparable with later years) have been revised to reflect the scope of the 1967 Census of Business. Significant changes are (1) kinds of business data for 1967 are in accordance with the 1967 edition of the U.S. Office of Management and Budget (formerly Bureau of the Budget) *Standard Industrial Classification Manual*, whereas the 1963 data are in conformity with the 1957 edition and its supplements; (2) the number of paid employees in 1967 was obtained from administrative records of the Internal Revenue Service while, in 1963, all census information was obtained directly from the companies; and (3) the number of active proprietors for 1967 is based on crediting sole proprietorships with one proprietor and partnerships with two proprietors for firms with first quarter 1967 payroll; for 1963, on crediting proprietors similarly but for all sole proprietorships and partnerships operated at any time during 1963.

T 372–374. Sales of wholesale establishments, 1939–1962.

Source: U.S. Bureau of Economic Analysis (formerly Office of Business Economics), 1939–1946, *Survey of Current Business*, October 1951, p. 24; 1946–1962, unpublished data (monthly averages published in *1963 Business Statistics*, p. 22).

These estimates exclude sales of corporate manufacturers, sales branches and offices, and the marketing stations of petroleum refiners which are included in the manufacturing series of the former Office of Business Economics. Sales of agents and brokers are included here on the basis of actual receipts of the agents and brokers rather than on the total value of goods sold. For 1939–1946, data are based on 1948 Census of Business definitions and classifications. The 1939 census data have been recast to conform to the 1948 census. Data for 1946–1962 are based on definitions and classifications in the 1954 Census of Business, with the 1948 census data adjusted to the scope of the 1954 census.

T 375–383. Sales, stocks, and stock-sales ratios of merchant wholesalers, 1948–1970.

Source: U.S. Bureau of Economic Analysis (formerly Office of Business Economics), *1971 Business Statistics*, p. 23.

The estimates are confined to merchant wholesalers since information on other types of wholesalers is not available except for years when the census of wholesale trade was taken. The 1963 Census of Business (to which the merchant wholesale data conform for the period since 1959) indicated that merchant wholesalers accounted for 44 percent of the sales and 74 percent of the inventories of all wholesale establishments.

The data exclude manufacturers' sales branches and sales offices, petroleum bulk stations and terminals, agents and brokers, and assemblers of farm products.

Sales include sales of merchandise and receipts from repairs or other services to customers, after deduction of returns, allowances, and discounts; and sales of merchandise for others on a commission basis. Local and State sales taxes and Federal excise taxes are included. Inventories represent stocks, at cost, of merchandise on hand for sale at the end of the month; they do not include goods held on a consignment basis or such items as fixtures, equipment, and supplies not held for sale.

The stock-sales ratios for a given year are derived by dividing the weighted average of seasonally adjusted end-of-month inventories (using the 13 observations including the yearend figures for the given and previous year) by the monthly average sales for that year. No adjustments have been made to bring inventory book values, which are typically valued at the lower of cost or market, up to the level of selling prices.

Figures for 1948–1958 are based on samples selected from the 1948 and 1954 censuses of business, and were adjusted by the former Office of Business Economics to the level of the sample selected from the 1958 Census of Business and Social Security Administration lists of wholesalers since 1958. These estimates are extrapolations based on data collected by the Census Bureau in the past, compiled with different samples.

In February 1966 a revised sample was introduced which included over 17,000 firms drawn from 1963 Census of Business lists representing all wholesalers (with paid employees) in business in 1963, and Social Security Administration lists of wholesalers (with paid employees) entering business (or requesting new Employer Identification numbers) since 1963. The Office of Business Economics in cooperation with the Bureau of the Census applied ratios calculated from the overlapping data to the previous estimates for 1959 through 1965 to make them comparable with the 1966 figures.

T 384–390. Wholesale trade margins of independent wholesalers, 1869–1947.

Source: See source for series T 225–244, p. 84.

See text for series T 225–244 for definition of "margin" and statement regarding reliability of the data.

Independent or regular wholesalers are types of wholesalers handling finished goods or construction materials for eventual distribution through some kind of retail outlet. This category excludes other kinds of wholesalers, such as brokers, commission merchants, manufacturers' sale branches, and chain-store warehouses.

T 391–443. Selected service establishments and receipts, 1929–1967.

Source: U.S. Bureau of the Census. 1929, unpublished data; 1933, *Census of American Business: 1933*, United States Summaries; 1935, *Census of Business: 1935, Service Establishments*, vol. I, *U.S. Summary* and *Census of Business: 1935*, Miscellaneous; 1939, *Census of Business: 1939*, vol. III, *Service Establishments*; 1948, *Census of Business: 1948*, vol. VI, *Service Trade—General Statistics*; 1954, *Census of Business: 1954*, vol. V, *Selected Service Trades—Summary Statistics*; 1958, *Census of Business: 1958*, vol. V, *Selected Services—Summary Statistics*; 1963, *Census of Business: 1963*, vol. VI, *Selected Services—Summary Statistics*; 1967, *Census of Business: 1967*, vol. V, *Selected Services—Area Statistics*, part 1.

Certain series have been combined for some years in order to provide as comparable historical series as possible. For some of the series, as noted below, data for some years were collected in other census programs. The series presented here cover that very limited segment of the services sector which bears greatest similarity to retail trade, specifically, personal, repair, and automotive services; hotels; and motels.

There have been numerous changes in enumeration methods, in accuracy, and in classifications over the years. The principal ones

are noted here; others can be noted by reference to the various census volumes. The 1954 and later censuses were conducted by mail canvasses of firms included in the active records of the Internal Revenue Service as subject to the payment of Federal Insurance Contributions Act (FICA) taxes and which were in appropriate kind-of-business classifications. Such data cover only firms with paid employees. The nonemployer segment was derived from a 50-percent sample of 1954, 1958, and 1963 tax returns. In the 1967 census, data for all nonemployers were compiled from tax records. The 1948 and earlier censuses were conducted by field enumeration. The differences in enumeration methods affect particularly the coverage of establishments without easily recognizable places of business and those leaving business prior to the end of the year. The 1954–1967 data are thus more complete in those areas. The 1933 and 1935 censuses were not taken under mandatory reporting requirements and may therefore be subject to some underenumeration. There are important gaps in enumerators' reports for 1933 so that substantial underenumeration, particularly of the smaller establishments, exists for 1933. Underenumerations have more effect on the number of establishments than on receipts.

In the 1963 and 1967 censuses, nonemployer establishments which did not operate the entire year have been included if, during the period they operated, their receipts were at a rate which would have reached an annual total of $1,000 or more had they operated the entire year. Establishments without paid employment and with less than $1,000 receipts were excluded in 1954 and 1958 tabulations. The data for 1948 (comparable with later years) show 1948 figures adjusted to this cutoff point. The data for 1948 (comparable with earlier years) exclude establishments which operated the entire year but had receipts less than $500. For 1939 and earlier years establishments having receipts of $100 or more are included (except as noted). Where two estimates are shown for 1939, the figures for 1939 (comparable with later years) represent a revision to conform to 1948 kind-of-business definitions.

Receipts for 1954 and later years include sales and excise taxes; receipts for 1948 and 1939 exclude them.

Establishments are classified according to their principal kinds of business. Changes in relative importance may thus serve to shift particular establishments among service categories or between service and retailing classifications from one census to another. Many service establishments derive some receipts from sales of merchandise; conversely, many establishments primarily engaged in the sale of goods, and hence included in retail trade, obtain some income from services. Receipts reported in each case *represent total receipts of establishments comprising the classification,* not receipts for the particular service indicated.

T 402–403, total personal services. Data for 1933 and 1935 represent groupings that correspond most closely to the 1939 scope.

T 410–411, photographic studios. Since the 1954–1967 data were obtained by mail canvass, they are believed to be substantially more complete than data for earlier years. For this industry, nonrecognizable establishments are likely to result in substantial underenumeration in a field canvass.

T 412–417, laundry, cleaning, and garment services. Included in series T 412 are power laundries, cleaning plants, press shops, linen supply, diaper service, industrial launderers, garment repair, and hand laundries. For 1933 and 1935, power laundries and dry cleaning plants with receipts of less than $5,000 were omitted. While series T 414 does not include the count of outlets owned and operated by dry cleaning plants, series T 415 does include the receipts of such outlets.

T 426–427, automobile repair shops. Data for 1935 include specialized shops as enumerated in the census of service establishments, and general repair garages as enumerated in the *1935 Census of Business, Retail Distribution,* table 1A. Data for 1933 cover only general repair garages, as enumerated in the *1933 Census of American Business, Retail Distribution,* table 1A, and the following types of specialized shops as reported in *1933 Census of American Business, Service Industries*: Paint shops, radiator shops, top and body repair shops, tire repair shops, and brake repair shops.

T 434–437, miscellaneous repair services. Separate data are available for some or all of the indicated years for several of the repair services in this group including shops engaged in armature rewinding, bicycle repair, blacksmithing, harness and leather goods repair, musical instrument repair, saw and tool repair, typewriter repair, upholstering and furniture repair, watch, clock, and jewelry repair, etc. Since the 1954–1967 data were obtained by mail canvass, they are believed to be substantially more complete than data for earlier years. In these industries, nonrecognizable establishments are likely to result in substantial underenumeration in a field canvass.

T 438–439, hotels, tourist courts, motels, trailer parks, and camps. Data for 1954–1967 are for establishments with payrolls only.

T 444–471. Volume of advertising, by medium, 1867–1970.

Source: Printers' Ink Publications, New York, N.Y., 1867–1934, *Printers' Ink Advertisers' Annual,* 1955 edition; 1935–1968, *Printers' Ink Advertisers' Guide to Marketing,* annual issues; 1969 and 1970, *Marketing/Communications,* July 1971.

The data were prepared by Robert J. Coen of McCann–Erickson, Inc., from information furnished by the American Newspaper Publishers Association, A. C. Nielsen Company, Publishers' Information Bureau, Farm Publication Reports, Inc., the Direct Mail Advertising Association, A. R. Venezian, Outdoor Advertising, Inc., and the Federal Communications Commission.

The data include the cost of preparation, and the cost of talent in the case of radio and television as well as the charges for space and time.

T 472–484. Indexes of national advertising expenditures, by medium, 1935–1970.

Source: Compiled by Robert J. Coen of McCann–Erickson, Inc., from annual dollar figures prepared and published in *Advertising Age,* Crain Communications, Inc., Chicago.

The general index, series T 472, is designed to reflect the changes in advertising dollar expenditures by national advertisers in major media. The national advertiser is usually a manufacturer of a product or service who does business in many markets across the country. National advertisers usually place their advertising through the facilities of an advertising agency and national media sales representative.

The index numbers for all media are based on estimates of the total expenditures made by advertisers to cover space and time charges as well as charges for programming, art and mechanical production expenses, and all commercial production items.

Estimates for the individual media are developed according to several general sources. Broadcast media estimates are derived from the financial reports of the Federal Communications Commission (FCC). The FCC provides comprehensive data on time sales revenue and also program revenue for network television, network radio, spot television, and spot radio. Adjustments are made to these figures to include additional allowances for commercial production expenses and some programming and talent charges not channeled through the stations or networks.

Magazine estimates are primarily based on the reports of the Publishers Information Bureau. Newspaper estimates are primarily based on the reports provided by the Bureau of Advertising of the American Newspaper Publishers Association. Business publications estimates are developed from data collected by the American Business Press. Outdoor estimates are developed from data provided by the Institute of Outdoor Advertising.

The above sources relate to the figures for the most recent years.

In some cases older historical data were derived from sources that are no longer in existence. All data are adjusted and linked in order to make the historical series comparable from year to year.

Data for all media include Alaska and Hawaii as well as expenditures for media in outlying areas of the United States.

T 485–491. Newspaper advertising—linage for 52 cities, 1928–1970.

Source: U.S. Bureau of Economic Analysis (formerly Office of Business Economics). 1928–1938, unpublished data; 1939–1946, *1969 Business Statistics*, p. 57; 1947–1970, *1971 Business Statistics*, p. 57.

Data represent newspaper linage in all newspapers, daily and Sunday, in the following 52 cities: Akron, Albany, Albuquerque, Atlanta, Baltimore, Birmingham, Boston, Buffalo, Chicago, Cincinnati, Cleveland, Columbus, Dallas, Dayton, Denver, Detroit, El Paso, Fort Worth, Hartford, Houston, Indianapolis, Jacksonville, Knoxville, Los Angeles, Memphis, Milwaukee, Minneapolis, Nashville, New Orleans, Oakland, Oklahoma City, Omaha, Pittsburgh, Portland (Oreg.), Reading, Richmond, Rochester, Salt Lake City, San Antonio, San Diego, San Francisco, Seattle, South Bend, Spokane, St. Louis, Syracuse, Tacoma, Toledo, Tulsa, Washington, Worcester, and Youngstown.

Series T 1–14. National Income Originating in Distribution and Selected Service Industries: 1869 to 1970

[In millions of dollars. Data represent net value added at factor costs]

* Denotes first year for which figures include Alaska and Hawaii.

[1] Includes kinds of business, not shown separately.

[2] Data prior to 1947 include estimates for nonmerchant wholesalers and are not comparable with data for later years.

[3] Comparable with later years; see text. 1948 data comparable with earlier years are (in millions of dollars): Series 67, 7,879; series 68, 3,683; series 69, 4,186.

[4] Comparable with earlier years; see text.

* Denotes first year for which figures include Alaska and Hawaii.
NA Not available. [1] For 1967, paid employees for week including March 12.
[2] Comparable with later years. [3] Comparable with earlier years.
[4] Average annual number of full-time and part-time employees for year; comparable figure for 1939 is 4,600,217.
[5] Totals include subclasses not shown separately.
[6] Figures include fish (sea food) markets. Separate figures not available.
[7] Includes music stores. [8] Excludes interior decorators.
[9] Nonfranchised dealers combined with franchised dealers.
[10] Excludes fuel oil dealers.

* Denotes first year for which figures include Alaska and Hawaii.
[1] Includes data for kinds of business not shown separately.
[2] Includes men's and boys' clothing and furnishings stores, and custom tailors.
[3] Includes women's ready-to-wear; other apparel, accessory, specialty shops; and furriers.
[4] New basis; adjusted to reflect the classification, definition, and distribution of firms by size according to the 1967 Census of Business.
[5] Old basis; based on the 1963 Census of Business.
[6] Data for series T 198–219 not comparable with previous years because of industry classification changes, and the shift of "nonstore" operations into the general merchandise group.
[7] New basis; adjusted to reflect the classification, definition, and distribution of firms by size according to the 1963 Census of Business.
[8] Old basis; based on the 1958 Census of Business.
[9] New basis; adjusted to reflect the classification, definition, and distribution of firms by size according to the 1958 Census of Business.
[10] Old basis; based on the 1954 Census of Business.
[11] No longer available separately; included in total for group
[12] New basis; adjusted to reflect the classification, definition, and distribution of firms by size according to the 1954 Census of Business.
[13] Old basis; based on the 1948 Census of Business.

* Denotes first year for which figures include Alaska and Hawaii.
NA Not available.
[1] Totals include subclasses not shown separately.
[2] Beginning 1959, includes music stores, not shown separately.
[3] Includes lumber yards; building materials dealers; and paint, plumbing, and electrical stores.
[4] Comparable with later years; see text.
[5] Comparable with earlier years; see text.
[6] No longer available separately; included in total for group.
[7] Includes nonstores, i.e., establishments selling merchandise primarily through coin-operated vending machines, house-to-house canvass, and mail orders.
[8] Includes sales made by mail order catalog desks located within department stores of mail order firms.
[9] Excludes garages primarily selling gasoline and oil.

* Denotes first year for which figures include Alaska and Hawaii.
NA Not available.
[1] Beginning 1954, excludes ready-mixed concrete distributors, no longer part of wholesale trade but included in selected service trade.
[2] Includes subclasses not shown separately.
[3] For workweek ended nearest March 12.
[4] Comparable with later years.
[5] Comparable with earlier years.
[6] Data for series T 274–279 for 1939, 1933, and 1929 are revised; revised data for other series for these years not available.
[7] Average annual number of full-time and part-time employees.
[8] Fresh fruit and vegetable wholesalers and poultry and dairy products distributors. Milk bottling plants are included in the 1948 (unrevised) and earlier data.
[9] Includes dressed furs.
[10] Includes 42 distilled spirits wholesalers with sales of 13 million dollars and operating expenses of 24.7 percent.
[11] Beginning 1954, includes musical instruments and sheet music wholesalers.
[12] Beginning 1948, includes air conditioning and ventilating equipment distributors. Such distributors were classified in the plumbing and heating category in earlier years but were of negligible importance.
[13] For 1954, 142 sales branches (with stocks) of steel works and rolling mill companies are included in metal distributors rather than manufacturers' sales branches. They had sales of 172 million dollars.
[14] Excludes wholesalers of shoe finding and cut stock; in 1929, 555 such establishments had sales of 56 million dollars. Persons engaged in optical goods segment partially estimated.
[15] Includes a moderate amount of underenumeration because, in the mail canvass, the activities of some branches and offices were reported as those of the manufacturing plant or an auxiliary establishment.
[16] Partly estimated.
[17] Figures not available separately for "manufacturers' sales branches (with stocks)" and "manufacturers' sales offices (without stocks);" figure shown is for both.
[18] Beginning 1954, excludes fish and seafood assemblers, which are included in the grocery, confectionery, meat group. In 1948 (adjusted) there were 544 such establishments with sales of 117 million dollars, and operating expenses of 23.5 percent.
[19] Operating expenses.
[20] Includes district and general sales offices.

Series T 372–374. Sales of Wholesale Establishments: 1939 to 1962

1929					[14] 3,328	[14] 963				

* Denotes first year for which figures include Alaska and Hawaii.
NA Not available.
[1] Paid employees for week including March 12.
[2] Comparable with later years. 1939 data comparable with earlier years are: Series 402, 388,918; series 403, 1,820 mil. dol.
[3] Comparable with earlier years.
[4] Average annual number of full-time and part-time employees.
[5] Includes subclasses not shown separately.
[6] About 7 percent represents repayment of cash advances which are not part of the cost of the complete funeral service. Receipts in prior censuses did not include such advances.
[7] Establishments with payroll only.
[8] Data prior to 1933 are as follows:

Year	Number of establishments	Receipts (mil. dol.)
1931	6,400	466.0
1929	6,776	541.2
1927	6,013	454.0
1925	4,859	362.3
1919 [2]	4,881	233.8
1919 [3]	5,678	236.1
1914	6,097	142.5

[9] For advertising agencies only.
[10] Covers only general repair garages, paint shops, radiator shops, top and body repair shops, tire repair shops, and brake repair shops.
[11] Includes boat repair shops not included in other years.
[12] Excludes refrigerator repair and washing machine repair establishments.
[13] Hotels only.
[14] Limited to hotels with 25 or more guest rooms.

Chapter U

International Transactions and Foreign Commerce

International Transactions and Foreign Aid (Series U 1-186)

U 1–74. General note.

This section presents statistics on the balance of international payments and the international investment position of the United States. Separate tables show the value of U.S. direct investments in foreign countries and of foreign direct investments in the United States, both by area and industry groups. The balance of international payments shows the economic transactions between residents of the United States and those of all other areas of the world during a stated time period. The international investment position indicates the value of U.S. investments abroad and of foreign investments in the United States at specified points of time. The change in the international investment position of the United States results partly from the movement of foreign and U.S. capital, as presented in the balance of international payments, and partly from other factors, such as changes in the valuation of assets or liabilities, including changes in the market value of securities, defaults, expropriations, writeoffs, and reinvested earnings of subsidiaries operating abroad and of foreign subsidiaries operating in the United States. U.S. direct investments in foreign countries include all foreign enterprises whose voting stock is owned to the extent of at least 25 percent by U.S. organizations or individuals, or in the management of which Americans have an important voice. In addition, they include unincorporated foreign branches or other direct foreign operations of U.S. interests, including mining claims, oil concessions, and other property held for business purposes such as real estate. Similarly, foreign direct investments in the United States cover U.S. business enterprises, including real estate investments, in which there was a foreign interest or ownership of 25 percent or more.

In all the series of this section, international organizations, such as the International Monetary Fund, the International Bank for Reconstruction and Development, and the United Nations, though located within the United States, are considered extra-territorial. Consequently, transactions between the United States and these organizations are considered international transactions of the United States, while transactions between them and foreign countries do not enter the balance of payments of the United States. U.S. holdings of their obligations and U.S. liabilities to them are part of the U.S. investment position.

U 1–25. Balance of international payments, 1790–1970.

Source: U.S. Office of Business Economics, 1790–1918 (except series U 24, 1874–1900), unpublished data; **series U 24,** 1874–1900, U.S. Department of the Treasury, *Annual Report, Director of the Mint,* 1921, p. 130. U.S. Bureau of Economic Analysis (formerly Office of Business Economics), 1919–1945, *Balance of Payments Statistical Supplement,* 1958, pp. 10–13; 1946–1970, *Survey of Current Business,* June 1970, p. 34; October 1972, pp. 26–27; June 1972, pp. 26 and 30.

Basically the figures for 1790–1918 are from publications by private authors; therefore, they are unofficial figures. However, the figures, as shown by these authors, have been rearranged and adjusted, and in some cases supplemented, for this volume by the former U.S. Office of Business Economics (OBE). The reclassified figures fit into the concepts and framework currently used in the official balance of payments statements prepared by OBE.

The original figures are from the following private publications: 1790–1860, Douglass C. North, "The United States Balance of Payments, 1790–1860," *Studies in Income and Wealth,* Princeton University Press, vol. 24, 1960; 1861–1900, Matthew Simon, "The United States Balance of Payments, 1861–1900," *Studies in Income and Wealth,* Princeton University Press, vol. 24, 1960; and 1901–1918 (with the exception of exports and imports of merchandise trade and silver), Paul D. Dickens, "The Transitional Period of American International Financing, 1897–1914" (unpublished doctoral dissertation, George Washington University, 1933), and C. J. Bullock, John H. Williams, and Rufus S. Tucker, "The Balance of Trade of the United States," *Review of Economic Statistics,* July 1919. Data on merchandise trade and silver for 1901–1918 were taken from Department of Commerce, *Monthly Summary of Foreign Commerce,* various issues.

The estimates for 1901–1918 were revised primarily to make them consistent with, and to link them to, data prepared for subsequent years. The revised estimates were published by Raymond W. Goldsmith in *Study of Savings in the United States,* Princeton University Press, 1956, vol. 1, pp. 1078, 1080, 1081, 1084, and 1086.

The Department of Commerce began its series in 1922, later extending the data backward to cover 1919–1921. Data for quarterly U.S. international transactions, total and with individual regions of the rest of the world, are available currently in the March, June, September, and December issues of the *Survey of Current Business.*

The balance of payments statement reflects all the exchanges of goods, services, gold, and capital claims between residents of the United States and residents of all other areas of the world. Since 1919, residents of the United States comprise residents of conterminous United States, Alaska, Hawaii, Puerto Rico, American Samoa, and Virgin Islands. Beginning 1940, residents of the Panama Canal Zone are also included. As noted above, international organizations are not regarded as residents of the United States.

Transactions entering into the balance of payments are divided into four categories—goods and services, unilateral transfers, capital movements, and transactions in U.S. official reserve assets. The balance of payments statement is built on a double entry system, whereby, in principle, every transaction is recorded both as a debit and a credit. Debits represent increases in assets or decreases in liabilities, and credits represent decreases in assets or increases in liabilities. Thus, an export of merchandise in return for a check drawn on a foreign account in a bank in this country results in a credit for the export (a reduction in an asset) and a debit for the reduction in foreign-held bank deposits (a reduction in a liability). Unilateral transfers to foreign countries (payments) are debits (as are expense items in accounting), and unilateral transfers from foreign countries (receipts) are credits (as are income items in accounting). While all transactions have a debit and credit phase which are necessarily equal, both sides are not estimated simultaneously nor from the same sources; hence, the possibility of error. The resulting discrepancy, referred to as "errors and omissions," series U 25, is given a plus or minus sign, depending upon which is necessary to make the accounts balance.

The procedure generally followed by North and Simon in their studies was to estimate receipts and payments on account of merchandise trade, transportation, travel, interest, dividends, and remittances. The authors then assumed that the balance indicated net flows of U.S. and foreign capital. For 1790–1900, series U 18–23

represents this balance which, of course, includes any errors and omissions in the estimates.

Data on exports and imports of merchandise used in the study by North are reported to include gold and silver prior to 1821 (see *Statistical Abstract of the United States, 1957*, p. 890). A separate estimate, however, was made by North for net movements of gold, because he concluded on the basis of his research that specie movements were in fact not included in the merchandise trade figures prior to 1821. (See "The United States Balance of Payments, 1790–1860," pp. 24–25.) This estimate is included in series U 2 and U 9. Although the annual amounts are small, varying from net exports of $1 million to $2.5 million to net imports of $1 million to $4 million, the residual item, or net movement of capital, may be in error by the same amount.

North indicates that the reliability of the data on exports prior to 1820 is doubtful and that data on imports are incomplete. The paucity of information also made the estimates for other transactions for this period considerably less satisfactory than for subsequent years. Consequently, North suggests that 5-year averages may be more reliable than the annual data. Such averages are included in his study.

For the classification and contents of series U 1–25, 1900–1918, see Raymond W. Goldsmith, cited above. Three transactions have been entered which did not appear in this study. See text below for series U 17 and U 18.

For methods of estimating later data, see *Balance of Payments of the United States, 1949–1951*, a supplement to the *Survey of Current Business*, Office of Business Economics. Continued changes and improvements in the methods of collecting data have been made and the figures have become progressively more reliable over time. For an evaluation of data for recent years, see Report of the Review Committee for Balance of Payments Statistics to the Bureau of the Budget, *The Balance of Payments Statistics of the United States: A Review and Appraisal*, April 1965.

U 2 and U 9, merchandise. The estimates for ship sales for 1790–1900 are included in exports, series U 2. For 1790–1819, the net export or import of specie is included in series U 2 or U 9, respectively. The gross movements of specie were not available. For 1820–1860, exports of specie are included in series U 2 and imports in series U 9. Exports and imports of gold for 1861–1873, of nonmonetary gold for 1874–1900, and of silver for 1861–1900 are included in series U 2 and U 9, respectively.

The data for 1901–1918 include merchandise trade proper, silver, and nonmonetary gold. The basic data on merchandise trade for 1919–1970 are the official trade statistics published until 1965 in *Foreign Commerce and Navigation* and since then in the foreign trade reports of the Bureau of the Census. For 1919–1970, adjustments in both exports and imports have been made to correct for known overvaluation or undervaluation, to exclude noncommercial items, to include an estimate for unrecorded trade, and to adjust for certain differences in territorial coverage, e.g., to exclude the trade with the Panama Canal Zone, beginning with 1940. For World War II and early postwar years, data on Government purchases were substituted for certain import data. For Government-financed transfers of merchandise, the figures based on fiscal records were used instead of the figures appearing in the recorded export statistics. For the years after World War I and World War II, sales and other transfers of surplus property located abroad were added to recorded export statistics. Prior to 1946, series U 2 also includes the transfers with or without compensation to allied countries of military equipment, including that purchased abroad under the Mutual Defense Assistance Program. A small amount of services connected with these transfers was also included. Series U 2 and U 9 include nonmonetary movements of gold. For the treatment of gold, see series U 24 below.

U 3 and U 10, transportation. For 1790–1819, series U 3 represents gross earnings on freight carried in U.S. ships. Some adjustment was made to eliminate earnings from ships carrying U.S. imports.

For 1820–1860, series U 3 includes earnings by U.S. ships from carrying U.S. exports and from carrying freight between foreign ports. It also includes American port charges paid by foreign ships. Transportation payments, series U 10, consist of freight payments to foreign ships for carrying U.S. imports, and expenditures of American ships in foreign ports. Port expenditures and receipts are estimated as a percentage of freight earnings by American and foreign ships, respectively. (Fare payments to American ships by immigrants are included in the estimate for immigrant funds. See discussion of series U 16, private unilateral transactions. For fare payments of tourists, see discussion of travel, series U 4 and U 11.) For 1861–1900, series U 3 includes ocean freight earnings from carrying U.S. exports and from carrying freight between foreign ports, and port expenditures in the United States of the foreign merchant marine and of passenger steamships. The estimates for the years 1871–1900 also include earnings from carrying overland freight. Payments for transportation, series U 10, includes ocean freight payments on U.S. imports, and expenditures in foreign ports by the U.S. merchant marine. Passenger fares are included in the travel account (series U 4 and U 11). The data for 1900–1918 include receipts and payments on account of ocean freight, and port charges. For 1916–1918, payments for charter hire were added.

For 1919–1970, the transportation category includes international freight, fares and shipboard expenses of travelers, revenues and expenditures resulting from the charter of vessels and the rental of freight cars, and the expenses of U.S. transportation companies abroad and foreign transportation companies in the United States. The data cover air and surface transportation.

U 4 and U 11, travel. For 1790–1819, no estimate was made for international travel expenditures. For 1820–1860, series U 4 includes tourist expenditures in the United States and their fare payments to American ships; series U 11 represents American tourist expenditures abroad. North assumed that American tourists going abroad and, for the most part, foreigners coming to the United States traveled on American ships during this period. The method employed in the source study for estimating tourism precludes the transfer of fare payments to the transportation account. For 1861–1900, series U 4 includes outlays of foreign travelers in the United States. It was assumed that alien travelers came to the United States on foreign lines and, therefore, no estimate was made for receipt of fares. Series U 11 includes payments abroad by American tourists for maintenance and for ocean fares. Simon assumed that the bulk of the travel during 1861–1900 was on foreign ships. The outlays for procurement of sundry items and luxury consumption goods were not included in his estimate for expenditures abroad by American tourists.

The data for 1900–1918 include fares paid to U.S. ships by foreign tourists and to foreign ships by U.S. tourists.

For 1919–1970, all expenditures made in the United States by foreign residents, except those of diplomats and other official personnel stationed here, are included in the travel receipts. Expenditures made in foreign countries by U.S. travelers for food, lodging, amusements, gifts, and other personal purchases constitute travel payments. Expenditures for transportation within or between foreign countries when purchased abroad are, in general, included as travel expenditures. However, passenger fares for overseas transportation to the ultimate destination (even if the ticket permits stopovers enroute) when paid to foreign carriers by U.S. residents, and when paid to U.S. carriers by foreign residents, are included in the transportation account.

U 5, U 6, and U 13, income on investments. For 1790–1900, series U 13 represents net payments of income on investments by the United States. The income was computed by applying an assumed yield rate to the net indebtedness of the United States.

For 1900–1918, separate estimates were made for receipts and payments. Series U 5 for 1915–1918 includes income on private and Government war loans. See Goldsmith, cited above, p. 1078.

For 1919–1970, income includes all interest, dividends, and branch

profits effectively paid or credited during the period, after payment of all taxes in the country in which the payer of income resides.

Private income, series U 5, for 1919–1970 includes interest, dividends, and branch profits from direct investments, and interest and dividends received from holdings of foreign bonds by residents in the United States, from stocks issued by foreign corporations which are not U.S. direct investments, from loans by banks and other financial or commercial organizations, from miscellaneous assets such as commercial real estate, insurance policies, commercial claims of various kinds, trusts and estates, and mortgages. Reinvested earnings, or the parent company's equity in the undistributed earnings on common stock of foreign subsidiary companies, are not included except for 1919–1929. Reinvested earnings are, however, regularly tabulated and used for computing changes in the international investment position of the United States.

Government income, series U 6, for 1919–1970 includes interest received by the U.S. Government on long- and short-term loans and other investments.

Income payments, series U 13, for 1919–1970 include payments of interest, dividends, and branch profits by foreign direct investment companies in the United States, interest and dividend payments to foreign holders of other American bonds and stocks (including U.S. Government securities), and payments of income on various miscellaneous assets such as estates and trusts.

U 7 and **U 14**, other transactions. Marine insurance and brokers' commissions constitute series U 14 for 1790–1819. No estimate was made for these transactions between 1820 and 1860. For 1861–1900, series U 7 consists of receipts on marine insurance; series U 14 comprises payments for marine insurance and net payments for brokers' commissions.

For 1900–1918, no estimates were made.

For 1919–1970, the coverage of miscellaneous service items has expanded and now includes receipts and payments from insurance transactions, communications, management services, motion picture and other royalties; receipts from fees of American engineering, construction, and consulting firms, from foreign contracts, from foreign governments in the United States, and expenditures of U.S. Government agencies abroad, except expenditures by the Department of Defense. The latter is included in series U 12, while receipts from abroad by the military agencies are included in series U 2.

U 12, military expenditures. This item includes direct outlays by the military agencies in dollars and in foreign currencies, as well as expenditures in the foreign economies by troops, civilian personnel of the military agencies, and post exchanges. It does not include expenditures of deutsche marks received from the Federal Republic of Germany or of yen received from Japan for the support of Allied and U.S. Forces stationed in the respective countries. Offshore procurement under military assistance programs and the purchase of goods and services to be transferred to other foreign countries under aid programs are included in the expenditures by military agencies.

U 16–17, unilateral transfers, net. No estimate was made prior to 1820 for series U 16. For 1820–1860, series U 16 represents the excess of funds brought into the United States by immigrants and their fare payments to American shipping companies over the amounts remitted abroad after their arrival in this country. For 1861–1916, series U 16 consists of the immigrant remittances and funds carried by immigrants into the country (+) and out (−). The estimate for immigrant remittances includes remittances through banks and an estimate for outlays by U.S. residents for prepayment of passage for friends and relatives planning to emigrate to the United States. For 1917 and subsequent years, remittances in cash and kind by religious, educational, and charitable institutions are also included. For series U 17, the entries of $0.6 million for 1794–1796 represent annual payments to the Barbary pirates. The payment of $11.2 million in 1803 was to France for the purchase of Louisiana Territory. The United States acquired sovereignty over this territory in 1803 and issued bonds for the amount of the purchase. These bonds carried an interest rate of 6 percent per year and were redeemed between 1812–1823. The interest during this period amounted to $8.2 million, $5.6 million of which was paid in the first 10 years. (See E. M. Douglas, *Boundaries, Areas, Geographic Centers and Altitudes of the United States and the Several States*, Washington, D.C., 1930.) Presumably the interest is included in the estimate for income payments, series U 13. The entries of $5.5 million for 1836–1838 represent receipts by the U.S. Government from France on behalf of American citizens in satisfaction of claims for indemnities arising from the Napoleonic wars. (See J. T. Adams, ed., *Dictionary of American History*, Scribner's, New York, 1940, vol. II, p. 348.) Interest of $0.5 million ($0.3, $0.1, and $0.1 million for 1836–1838, respectively) is included. In 1848, at the end of the Mexican War, the United States and Mexico signed the treaty of Guadelupe-Hidalgo which gave to the United States the present States of Arizona, New Mexico, California, Nevada, Utah, and Colorado west of the Rockies. The payment by the United States of $15 million for this territory, plus interest of $1.4 million, is represented by the entries for 1849–1852. These entries were referred to in the study, "United States Balance of Payments, 1790–1860," as indemnity payments and entered in the capital account. The entries for 1854–1856, aggregating $10 million, represent the Gadsden purchase. Russia, in March 1867, agreed to sell Alaska to the United States for $7.2 million in gold. The United States took possession in fiscal year 1868, but payment was not made until fiscal year 1869. During the Civil War, Great Britain had sold to the Confederate States ships which were used as privateers to sink the Union ships. An international tribunal in 1873 held Great Britain liable to the extent of $15.5 million. Payment was made to the United States in 1873, as indemnity on behalf of its citizens. The treaty of peace with Spain in 1898, as a result of which the Philippines, Guam, and Puerto Rico were ceded to the United States, stipulated a payment to Spain of $20 million.

The figures for series U 17 include two transactions which are not included in Goldsmith's *Study of Saving . . .*, mentioned earlier for the 1900–1918 period. In 1904, the U.S. Government paid $10 million to the Republic of Panama for lease of the Panama Canal, and in 1917, the United States bought the Virgin Islands from Denmark for $25 million. These transactions appear in series U 17.

For 1919–1970, series U 17 consists of Government transfers of goods, services, or cash, in both dollars and foreign currencies, for which payment by the foreign country has not been made, is not expected, or has not been specified, less reverse lend-lease, counterpart funds on certain foreign-aid programs, and other receipts. Series U 17 also includes Government payments of pensions, receipts or payments for idemnities, intangible rights, or other considerations.

U 18–23, U.S. capital flows, net, and foreign capital flows, net. For 1790–1900, the data for series U 18 and U 23 represent the net flow of U.S. and foreign capital, and were estimated as residuals, to balance the other items in the balance of payments. Consequently, they reflect errors and omissions in the estimates of the other items. For some of these years, particularly 1861–1900, the data shown here differ from those in the source studies because of adjustments in some of the other series. For 1900–1918, see Goldsmith, cited above, pp. 1080–1081.

In 1904, the figure for series U 18 includes the payment by the U.S. Government of $40 million for the original Panama Canal Company. This transaction was not included in Goldsmith's *Study of Saving*.

For 1919–1970, the data for series U 18–21 represent changes in assets or in investments of the United States abroad. The long-term transactions represent shifts in capital claims of indefinite maturity or of a stated original maturity of more than one year from the date of issuance. Short-term transactions represent changes in claims on foreigners with a maturity of one year or less. For 1919–1970, series U 18 (long-term) includes disbursements of foreign loans, net of repayments, by all U.S. Government agencies, whether made in dollars or in foreign currencies. Also included are movements of

capital related to the operation by the U.S. Government of productive facilities abroad, and U.S. capital contributions to international organizations such as the International Monetary Fund, the International Bank for Reconstruction and Development, and the International Finance Corporation. Loan operations between these organizations and foreign countries are not included since such organizations are regarded as foreign entities in the U.S. balance of payments. Loans made by private banks and guaranteed by the Export-Import Bank are included in series U 20. Real property purchased by the Government for administrative purposes is included in series U 14, other transactions, while all expenditures of religious, educational, and charitable institutions are included in series U 16, unilateral transfers, even if they involve the purchase of fixed assets. For 1919–1970, series U 18 (short-term) includes changes in the U.S. Government short-term claims arising from holdings of foreign currencies (received as a counterpart to foreign grants or through sales of agricultural and other surplus products), deposits abroad, and various advances.

For 1919–1970, the shifts in capital claims in series U 19 and U 20 refer not only to securities (stocks, bonds, mortgages, etc.) but also to real property (farms, branch factories, and real estate). Series U 19 consists of net purchases of stocks in, and of changes in, net claims by U.S. parent companies against foreign incorporated companies in the management of which U.S. companies have an important voice, and net changes in the equity in foreign branches of U.S. companies. Series U 20, other private long-term capital movements, consists of U.S. purchases of newly issued foreign securities, amortizations of foreign bonds, net transactions in outstanding foreign securities, and net changes in long-term claims reported by U.S. banks (including loans made by private banks and guaranteed by the Export-Import Bank) and other commercial enterprises.

Series U 21 includes changes in bank deposits, brokerage and commercial balances, and uncollected bills.

For 1919–1970, the data for series U 22–23 represent changes in liabilities of the United States to residents of foreign countries, or changes in assets held in the United States by residents of foreign countries. Series U 22 represents shifts in foreign claims on the United States with an original maturity of more than one year, including changes in the investments of foreign corporations in their branches and subsidiaries in the United States, and transactions by foreigners in the U.S. public debt obligations. Series U 23 represents shifts in the liabilities of the U.S. Government and of private individuals and institutions with an original maturity of one year or less. Foreign short-term claims on the U.S. Government include deposits with the Treasury and other Government agencies and changes in foreign holdings of U.S. Government short-term obligations. Foreign short-term claims on private Americans include foreign deposits in U.S. banks, changes in holdings of privately issued short-term securities, and other commercial liabilities. The data also include an estimate of movements of U.S. currency and coins.

U 24, transactions in U.S. official reserve assets, net. This entry measures net changes in the official reserve assets of the United States, which consist of U.S. holdings of monetary gold, special drawing rights (SDR), convertible foreign currencies, and gold tranche position in the International Monetary Fund (IMF).

Monetary gold includes the U.S. gold stock held by the U.S. Treasury and the Exchange Stabilization Fund. (On December 9, 1974, Treasury acquired all gold held by the Exchange Stabilization Fund.) The transactions also included gold sold to the United States by the IMF with the right to repurchase, and gold deposited by the IMF to mitigate the impact on the U.S. gold stock of foreign purchases for gold subscription to the IMF under quota increases. Special drawing rights are international reserve assets created through amendments to the Articles of Agreement of the IMF to provide orderly and adequate growth in international liquidity. Thus far (1974) there have been three annual allocations to the United States and other participating nations made on January 1, of 1970, 1971, and 1972. U.S. holdings of special drawing rights in the Special Drawing Account in the IMF include allocations and acquisitions, net of use. Convertible foreign currencies represent Treasury and Federal Reserve System holdings of convertible foreign currencies in U.S. dollar equivalents. The U.S. gold tranche position in the IMF represents the amount that the United States could purchase in foreign currencies automatically if needed; it is equivalent to the U.S. quota in the IMF minus the Fund's holdings of U.S. dollars.

U 25, errors and omissions. As indicated above, this is the residual item which has been given the sign (+ or −) necessary to make the statement balance. It compensates for missing data, possible errors in the estimates, as well as for seasonal and other leads and lags in the reporting of the debt and credit phases of transactions which are compensating over a period of time.

U 26–39. International investment position of the United States, 1843–1970.

Source: 1843–1914, Cleona Lewis, *America's Stake in International Investments*, The Brookings Institution, Washington, D.C., 1938 (copyright). 1919–1945, U.S. Office of Business Economics, various publications. 1946–1970, U.S. Bureau of Economic Analysis (formerly Office of Business Economics), *Balance of Payments Statistical Supplement, Revised Edition;* and *Survey of Current Business*, August 1963 and 1964, September 1965 and 1966, and October 1968–1972.

The estimates for 1919–1945 are based on the following publications: (1) *The United States in the World Economy*, Office of Business Economics, Economic Series No. 23, Washington, D.C., 1943, p. 123; (2) *The Balance of International Payments of the United States in 1931*, Bureau of Foreign and Domestic Commerce, Trade Information Bulletin No. 803, Washington, D.C., 1932, pp. 44, 48, and 62; (3) *Foreign Investments in the United States*, Bureau of Foreign and Domestic Commerce, Washington, D.C., 1937, p. 5; (4) Cleona Lewis (see source above for 1843–1914); (5) *International Transactions of the United States During the War 1940–45* (as revised), Office of Business Economics, Economic Series No. 65, 1948, p. 110.

In *America's Stake in International Investments*, direct investments are based on book value wherever possible; portfolio investments are calculated at par value for bonds and preferred stocks, and at market value for common stocks. Similar practices were followed in the estimates of the Department of Commerce for 1930, 1931, and 1935; miscellaneous portfolio investments for the same years were calculated at market values wherever possible. For 1940, 1945, and 1946–1970, the values of bonds and preferred stocks as well as of common stocks were calculated at market prices wherever possible.

The estimates for these series prior to 1919 were prepared by compilers who used different valuation methods and whose data varied in completeness. While the estimates are therefore not homogeneous, they do present rough indications of the magnitudes involved.

U 40. International investment position of the United States (net liabilities), 1789–1900.

Source: 1789–1860, Douglass C. North, "The United States Balance of Payments, 1789–1860," cited in text for series U 1–25; and 1861–1900, Matthew Simon, "The United States Balance of Payments, 1861–1900," also cited in text for series U 1–25. (Copyright.)

In the source studies, a net liability of $60 million was estimated for 1789. For the following years, the changes were computed by adding the annual net international flow of capital which is the balancing item, series U 18–23, for exports and imports of goods, services, and unilateral transactions. For certain years, adjustments were made for defaults. Differences between the accumulating "net indebtedness" in the source studies and the data in series U 40 are due to adjustments incorporated in series U 1–25 as explained in the text for those series.

U 41–46. Value of direct investment in foreign countries, by area and industry groups, 1929–1970.

Source: See source for series U 26–39.

See also general note for series U 1–74, and text for series U 18–23.

U 47–74. Value of foreign direct investment in the United States, by area and industry, 1937–1970.

Source: U.S. Office of Business Economics, 1937–1961, *Foreign Business Investments in the United States*, 1962; 1962–1970, *Survey of Current Business*, various issues (usually September or October).

The basic data for these series were derived from reports filed with the Department of Commerce by enterprises in the United States in which there was a foreign interest of 25 percent or more. Reports were required by law under section 8 of the Bretton Woods Agreements Act (59 Stat. 515, 22 U.S.C. 286f). Forms and instructions were mailed directly to lists of companies developed from tax records, news reports, previous census studies, and records of the Office of Business Economics.

In general, a report was required for every U.S. business enterprise, including real estate investments, in which a foreign person or organization owned 25 percent or more of the voting stock, and for similar interests in noncorporate enterprises. A report was required both when the 25 percent foreign interest was direct in a U.S. primary organization or was indirect in a subsidiary, called a secondary organization.

There were certain exemptions from filing a report, as follows: (a) If the value of total assets was less than $50,000, a report was required only for information identifying the reporter; (b) reports were not required from religious bodies, charitable organizations, or other nonprofit organizations in the United States; (c) reports were not required in connection with real or personal property acquired for personal use or occupancy.

The coverage is believed to be quite complete for substantial industrial investments. However, there are probably many small trading organizations and holdings of real estate not covered. The extent of these investments is not believed to be significant.

It should be noted that this survey does not cover portfolio foreign holdings of U.S. corporate securities, or other miscellaneous investments here.

Direct foreign investments in the United States included the following U.S. business enterprises for which reports were required: (1) A U.S. corporation in which 25 percent or more of the voting stock was owned directly or indirectly by a foreign person or organization; (2) branches of foreign corporations resident in the United States; (3) partnerships and proprietorships resident in the United States in which 25 percent or more ownership was held by a foreign person or organization; (4) U.S. enterprises held as part of an estate or trust created under the laws of the United States in which foreign beneficial owners held an interest of 25 percent or more; (5) real estate and other real property, including leaseholds, acquired for commercial purposes, in which an interest of 25 percent or more was held by a foreign person or organization.

These series cover the 50 States, the District of Columbia, the Commonwealth of Puerto Rico, the Panama Canal Zone, and outlying areas of the United States.

Each reporter or foreign-owned U.S. company was classified by the country of the foreign parent organization. Secondary reporters or subsidiaries of the primary organization were given the same country classification as the primary.

The major areas for classification were Canada, United Kingdom, other Western Europe, Latin American Republics, Asia, Africa, and Australia. The investment was generally quite small for countries in Asia, Africa, or Latin America.

The Standard Industrial Classification (SIC) issued by the then Bureau of the Budget was the basic guide used for classifying reporters by industry. However, certain departures were made in connection with grouping certain industries into major divisions. This change in grouping consisted, for the most part, in shifting certain industries to major divisions on the basis of their relationship or integration of operations. For example, reporters engaged in petroleum production and others engaged in petroleum refining were classified under petroleum as a major industrial division. The SIC had no such classification and production is included under mining (not shown separately here) and refining under manufacturing. Similarly, other integrated operations of oil companies were included under petroleum.

Frequently a reporter was engaged in more than one business activity, especially in those cases where the report furnished was a consolidation of several companies in different lines of business. Such a report was classified according to the basic activity involved.

Reporters who were primarily holding companies of U.S. operating companies were classified according to the industry of the operating companies.

U 75–186. U.S. Government foreign grants and credits, by country, 1945–1970.

Source: U.S. Bureau of Economic Analysis, unpublished summary of data published in more detail in "Foreign Aid by the United States Government, 1940–1951," a 1952 supplement to the *Survey of Current Business*, and in the periodic report, *Foreign Grants and Credits by the United States Government.*

The following text was excerpted from *Annual Report of the Bretton Woods Agreement Act* (Communication from the Chairman, National Advisory Council on International Monetary and Financial Policies), 93d Congress, 1st session, House Doc. No. 93–34, pp. 120–122.

These series were compiled by the Bureau of Economic Analysis from information made available by agencies operating the grant, credit, and other assistance programs, and include some estimates for transactions not yet recorded on the operating agencies' books. Items based on estimates have been adjusted or qualified on the basis of information received to the date of preparation of these series, but in some instances are subject to future adjustments.

The data on credits are comparable, with minor exceptions, to those appearing in *Foreign Credits by the United States Government*, a semiannual publication of the Department of the Treasury, in which a detailed enumeration of every active foreign credit of the U.S. Government, showing its current status, is presented.

The data are divided into three categories—grants, credits, and other assistance through net accumulation of foreign currency claims under programs for the sale of agricultural commodities. The Government's capital investments in, or contributions to, the international financial institutions constitute an additional measure taken by this Government to promote foreign economic recovery and development. Payments to these institutions do not result in immediate equivalent aid to foreign countries. Use of available dollar funds is largely determined by the managements of the institutions, in some instances subject to certain controls which can be exercised by the U.S. Government. Changes in the procedures for disbursing the U.S. Government contributions, initiated in 1965, have retarded such actual Government payments to agree more closely with the actual disbursement of assistance by the international institution to the foreign country.

Grants are transfers for which no payment is expected, or which at most involve an obligation on the part of the receiver to extend aid to the United States or other countries to achieve a common objective. *Credits* are loan disbursements or transfers under other agreements which give rise to specific obligations to repay, over a period of years, usually with interest. *Other assistance* represents the transfer of U.S. farm products in exchange for foreign currencies (*plus*—since the enactment of Public Law 87–128—principal and interest collections in foreign currencies for credits extended under the farm products sales program) *less* the Government's disbursements of the currencies as grants, credits, or for purchases. The net acquisition of currencies

represents net transfers of resources to foreign countries under the agricultural programs, in addition to those classified as grants or credits.

Occasionally, assistance has been given under indeterminate conditions, subject to future settlement. Indeterminate aid on this basis is included with grants, in the period rendered. When settlement for such indeterminate aid is agreed upon, the terms may call for a cash settlement or may establish a long-term credit. Cash settlements are included in returned grants. Amounts of the newly established credits are added to outstanding indebtedness.

The U.S. Government receives some returns on its gross grants and credits. The returns which are deducted from gross grants and credits to arrive at net grants and credits include (1) reverse lend-lease; (2) the dollar value of the portion of grant counterpart funds paid to the United States for its use; (3) returned lend-lease and civilian supply ships; (4) returns of military equipment "loaned"; (5) cash received in war-account settlements for lend-lease and other aid; and (6) principal repaid on credits, but not interest. The Government's disbursements of currencies are deducted from the accumulation of currency claims in calculating net other assistance.

The measure of foreign grants and credits generally is in terms of (1) dollars disbursed by the U.S. Government to or for the account of a foreign government or other foreign entity or individual, and (2) dollar equivalents of goods delivered or shipped, services rendered, or foreign currencies disbursed to or for such foreign account. Correspondingly, returns are measured in terms of the dollars received by the U.S. Government, or the dollar equivalents of goods, services, and foreign currencies received. Dollar equivalents are, of necessity, frequently estimated.

Assistance is shown by country, or general area, where possible. In certain instances (particularly in the earlier postwar period), data for parent countries include those for their dependent area; for example, although goods have been shipped to a then dependent area, Tunisia, such aid was reported as rendered to the parent country, France.

Transactions shown for a country are *not* necessarily with the government of such country, but are often with individuals, relief organizations, international organizations, or other private entities located in the designated country and considered to be within its economy.

More Recent Data for *Historical Statistics* Series

Statistics for more recent years in continuation of many of the still-active series shown here appear in annual issues of the ***Statistical Abstract of the United States***, beginning with the 1975 edition. For direct linkage of the historical series to the tables in the ***Abstract***, see Appendix I in the ***Abstract***.

Series U 1–25. Balance of International Payments: 1790 to 1970

[In millions of dollars. For fiscal years, 1790–1900; thereafter, calendar years]

Year	Exports of goods and services [1]							Imports of goods and services						
	Total	Merchandise, adjusted [2]	Transportation	Travel	Income on investments abroad		Other transactions [5]	Total	Merchandise, adjusted	Transportation	Travel	Direct military expenditures	Income on foreign investments in U.S. [6]	Other transactions [5]

[1] Prior to 1946, includes transfers of goods and services under U.S. military grant programs.
[2] Includes receipts from military cash and credit transactions, the major portion of which is merchandise.
[3] 1919–1929, includes reinvested earnings of subsidiaries.
[4] Beginning 1946, income on investments includes direct investment fees and royalties.
[5] 1919–1939, includes certain adjustments to merchandise transactions.
[6] Net for 1790–1900.
[7] Comparable with later years.
[8] Comparable with earlier years.
[9] Military expenditures in Mexico.
[10] 1933, includes a net outflow of $40 million and, 1934, a net inflow of $30 million of funds through arbitrage operation in securities which cannot be divided between domestic and foreign securities.
[11] Includes transactions in securities which cannot be separated between domestic and foreign.
[12] Included in figures for series 18–23.

[1] Includes Eastern Europe in 1929, 1936, and 1940, amounting to $89 million, $93 million, and $259 million, respectively. Excludes Turkey for 1936 and 1940.
[2] Includes Turkey for 1936 and 1940, and Western European dependencies for 1929, 1936, and 1940.
[3] Combined with "Other countries."
[4] Includes $26 million reported as "International."
[5] Beginning 1950, included in "Other."
[6] For 1970, "Transportation, communication, and public utilities" and "Trade" included in "Other."
[7] Excludes insurance in 1929; includes "Agriculture" beginning 1950; includes "Transportation, communication, and public utilities" and "Trade" in 1970.

Series U 47–74. Value of Foreign Direct Investment in the United States, by Area and Industry: 1937 to 1970

[In millions of dollars. Book value at yearend. Covers U. S. business enterprises, including real estate investments, in which there was a foreign interest or ownership of 25 percent or more]

– Represents zero.
Z Less than $500,000 or net minus (−) of less than $500,000.

[1] Beginning 1964, Department of Defense transactions estimated.

[2] Asian Development Bank, Inter-American Development Bank, International Bank for Reconstruction and Development, International Development Association, and International Finance Corporation.

[3] Net new grants not adjusted for settlements for postwar relief and other grants under agreements, and net new credits exclude prior grants converted into credits, which were as follows: July 1945-December 1955, $2,198 million; 1956–66, $491 million. Repayments on these settlements included in net new credits.

[4] Developed countries include Australia, Canada, Japan, New Zealand, Republic of South Africa, and countries of Eastern and Western Europe except Spain, Yugoslavia, and Malta. Developing countries include all other countries.

[5] Outstanding credits on Dec. 31, 1970, totaled $27,568 million representing net credits extended since organization of Export-Import Bank, Feb. 12, 1934, less charge-offs, and net adjustments due to exchange rates ($989 million), and excluding World War I debts. The amount repayable in dollars at U.S. Government option was $20,131 million; the remainder was repayable in foreign currencies, commodities, or services, at the option of the borrowers.

[6] Equivalent value of currencies still available to be used, including some funds advanced from foreign governments and after loss by exchange rate fluctuations ($1,334 billion), was $1,446 billion on December 31, 1970.

[7] United Nations Relief and Works Agency for Palestine refugees.

[8] Separate data became available during 1954. For earlier periods, data shown as Indochina.

Chapter U

Foreign Commerce (Series U 187-352)

U 187–352. General note.

Statistics on foreign trade of the United States are among the most useful, revealing, and, in spite of their deficiencies, reliable series relating to the growth of the American economy. This situation is especially true for the first 100 years of the Republic. The United States was more heavily dependent upon foreign markets and sources at that time than it has been in the 20th century. For a fuller discussion of the usefulness of such data, see G. G. Huebner's review of foreign trade of the United States in Emory Johnson, *History of Domestic and Foreign Commerce of the United States*, Carnegie Institution, Washington, D.C., 1915. This study has an excellent bibliography of material on foreign trade available at that time.

Since the first appearance of the *Statistical Abstract of the United States* in 1878, official time series on foreign trade have been presented in that publication and it is, therefore, cited here as a primary source for certain of the foreign trade data shown.

Foreign trade data are subject to a variety of special statistical problems relating to compilation, publication, coverage, valuation, and classification as to composition and direction. The record of gold movements, in particular, has been found to be subject to considerable error owing to its peculiar qualities which make it both a useful form of money and a likely candidate for smuggling (see R. G. D. Allen and J. Edward Ely, *International Trade Statistics*, John Wiley and Sons, New York, 1953; and Oskar Morgenstern, *Validity of International Gold Movement Statistics*, Special Paper in International Economics No. 2, International Finance Section, Princeton University Press, November 1955).

The first Congress of the United States provided for the compilation of statistics on foreign trade, and the Treasury Department, through its customhouses, began keeping a record of foreign trade beginning August 1, 1789. According to the Treasury Department, government records of the total values of our imports for 1790 to 1820 are fairly complete but do not show, except for a few years, the articles imported. They show, however, domestic exports by articles, but do not distinguish the values of merchandise from coin and bullion imported and exported, nor the value of the commerce with each country (see *Statistical Tables Exhibiting the Commerce of the United States With European Countries From 1790–1890*, Washington, D.C., 1893, p. vii).

Compared with currently compiled statistics, these earliest records left a great deal to be desired. J. Edward Ely, writing on the historical development of foreign trade statistics, observes that:

> The United States may be said to have had an adequate set of import and export statistics only since about 1821. Prior to that time no information was compiled on the amount of imports of articles which were free of duty upon importation into the United States. No value figures were compiled on imports subject to specific rates of duty and the dollar value for imports subject to ad valorem rates of duty, although apparently accurate, was compiled only as a total with no information on how much of each commodity was imported. Existing figures on the total dollar value of imports during the years 1795 to 1801 were apparently estimated at the time by the Secretary of the Treasury, and the figures for 1790–1794 and from 1802–1820 were apparently estimated many years later. (Allen and Ely, cited above, p. 269.)

Douglass North observes that the 1789–1820 figures were "officially overhauled and published in the Report of the Secretary of the Treasury on Finances for 1835" (see North's "United States Balance of Payments, 1790–1860," *Studies in Income and Wealth*, vol. 24, National Bureau of Economic Research, 1960). In employing the early records, North found a number of deficiencies, and users of figures for 1790–1820 should note his revised figures and consider the criticisms in the appendix to his paper. The adequacy of the early records, of course, depends upon the use made of them. Some of the earliest records were not published officially and scholars have had to depend on information from *A View of the United States of America*, published by Tench Coxe in 1794, giving official documents for 1790, 1791, and 1792; *A Statistical Manual for the United States of America*, by Samuel Blodget, Jr.; *A Statistical View of Commerce of the United States of America*, by Timothy Pitkin, New Haven, 1835 (reprinted by Johnson Reprint Corporation in 1967), presenting many tables obtained directly from the Treasury books; and *Statistical Annals* by Dr. Adam Seybert, covering the period 1789–1818, and giving statistics of population, commerce, public land, etc. Such data as were published annually for 1790–1820 were brought together later in U.S. Congress, *American State Papers*, Class 4, "Commerce and Navigation," two volumes, Gales and Seaton, Washington, D.C., 1832 (vol. I) and 1834 (vol. II).

In 1820, Congress passed a law to provide for obtaining accurate statements of the foreign commerce of the United States and, at the same time, established the Division of Commerce and Navigation in the office of the Register of the Treasury. It required collectors of customs to compile and transmit annual reports to that office showing the detailed trade with foreign countries and the navigation employed therein. Beginning with 1821, these reports were consolidated and published annually in *Commerce and Navigation of the United States*.

Foreign trade statistics published by the Federal Government after 1820 are regarded as superior to those for the earlier period but still subject to some deficiencies, notably with respect to valuation of imports. They also suffered in respect to coverage of overland exports (see North, cited above, app. II, and Allen and Ely, cited above, pp. 270–271).

The Civil War introduced two special difficulties. For the last three quarters of fiscal year ending June 30, 1861, certain ports of the Southern States failed to make reports, and it was necessary for the Treasury Department to introduce estimates of the exports of cotton by the Southern States during the war based on records of the main recipient countries in Europe (see Treasury Department, *Statistics of the Foreign and Domestic Commerce of the United States*, Washington, D.C., 1864, p. 39).

The second difficulty was introduced in 1862 when the United States abandoned the specie backing for its money. The dollar fluctuated against foreign currencies and gold with each reverse or success of the northern forces. While imports and reexports continued to be valued in specie (dollars of a fixed parity to gold), since these goods were initially expressed in foreign currencies, domestic exports were recorded in "mixed values"—partly gold dollars and partly dollars of a fluctuating value—from 1862 until the resumption of specie payment in 1879. These deficiencies were recognized at the time both officially by the Director of the Bureau of Statistics (established in the Treasury Department in 1866) and by private observers (see, for example, Louis Blodgett's criticism and evaluation of U.S. foreign trade statistics in the early 1860's in *The Commercial and Financial Strength of the United States as Shown in the Balances of Foreign Trade and the Increased Production of Staple Articles*, King and Baird, Philadelphia, 1864). Treasury statisticians sought to adjust mixed currency values to specie values of total imports and

exports and some other broad aggregates. The adjustments, however, were not carried through completely to country and commodity detail, and only a limited number of domestic export series are available for 1862–1879 in terms of "specie values" while the domestic export figures for countries and individual commodities are only available in mixed currency values.

When Congress established the Bureau of Statistics in 1866, it also specified that the kinds, quantities, and values of all articles exported and imported should be distinctly set forth in the statistical accounts, by countries of destination or of shipment, and that the exports of articles produced or manufactured in the United States should be shown separately from the reexports of foreign articles imported into the United States. Prior to 1866, only annual statistics of the foreign commerce of the United States were published; since then, monthly statistics have also been published.

The first report of the Director of the Bureau of Statistics in 1867 contains several pointed criticisms of the previous statistics, and the subsequent annual reports of *Foreign Commerce and Navigation* emphasized the shortcomings of the figures presented, especially the difficulty which became important in the post-Civil War period of reporting on trade with Canada in the absence of any mandatory reporting requirement on the railroads (see, for example, the *Annual Report of the Chief of the Bureau of Statistics on the Commerce and Navigation of the United States for the Fiscal Year Ended June 30, 1877*, 1878, pp. xii-xiii, table showing ". . . the imports into Ontario, Quebec, and Manitoba, from the United States in excess of the domestic exports from the United States to Canada, as returned to the Bureau of Statistics by U.S. collectors of customs during the fiscal year ended June 30, 1877."). An act of March 3, 1893, provided for obtaining information on exports by rail and apparently eliminated this deficiency in the subsequent figures, but prior to that time trade totals and figures on trade with Canada suffer lack of coverage in varying degrees.

For additional comments on foreign trade data for 1861–1900, see Matthew Simon, "Statistical Estimates of the Balance of International Payments and the International Capital Movements of the United States, 1861–1900," *Studies in Income and Wealth*, vol. 24, National Bureau of Economic Research, 1960.

In 1923, the function of compiling foreign trade statistics was transferred to the Department of Commerce; however, the release and publication of the annual figures had been done by that Department since 1903. In 1941, the function was transferred from the Bureau of Foreign and Domestic Commerce to the Bureau of the Census.

A problem affecting comparability of value statistics arose between January 31, 1934, and March 10, 1953, when the foreign exchange value of the dollar was permitted to depreciate as a result of the restriction placed on gold shipments to foreign countries. For this period, unless otherwise noted, values stated are in U.S. dollars without reference to changes in the gold content of the dollar.

World War II and the special foreign aid programs following it introduced new complications into the handling of U.S. foreign trade statistics. Lend-lease during the war, surplus property disposal immediately after the war, War Department shipments to relieve disease and unrest, economic and military aid, and security shipments have all complicated the presentation as will be noted below.

Import data compiled by the Department of Commerce are from import entries (various Customs forms) which importers are required to file with customs officials for each shipment arriving. Import values are, in general, based on market or selling price and are f.o.b. the exporting country. Values do not include import duties. The country of origin is defined as the country in which the merchandise was grown, mined, or manufactured. If the importer cannot obtain the information as to the country of origin, the merchandise is credited (for statistical purposes) to the country of shipment.

Imports are classified either as general imports or imports for consumption. General imports represent total arrivals of imported goods (except for intransit shipments), that is, merchandise released from Customs custody immediately upon arrival plus merchandise entered into a customs-bonded storage, manufacturing, or refining warehouse immediately upon arrival. Imports for consumption comprise merchandise entered into the U.S. consumption channels, that is, merchandise released from Customs custody immediately upon arrival, merchandise entered into a customs-bonded manufacturing warehouse (other than smelting or refining warehouse), merchandise withdrawn from a customs-bonded storage warehouse for release into domestic consumption channels, and imported ores and crude metals which have been processed in a customs-bonded smelting warehouse and then withdrawn for consumption and export.

During past periods, data for some low-valued imports have been fully compiled while data for others have been estimated. The following changes have occurred in the methods of compiling data on low-valued imports: Effective January 1954–1957, imports valued at $250 or less, reported on formal consumption and informal entries, were estimated from a 5-percent sample. From January 1958-June 1965, formal entries valued under $100 and informal entries valued $250 or less, were estimated from a 1-percent sample. Effective July 1965, all formal and informal entries valued $250 and under have been estimated from a 1-percent sample except a 5-percent sample, in effect every 3 years, was used to estimate data for 1967 and 1970. The estimated import values are excluded from detailed commodity statistics but are included in the over-all totals and are distributed in the appropriate country, district, and economic class totals, and in the totals for groupings of commodity classifications (i.e., commodity group or subgroup). The total value so excluded generally amounts to about 1 percent of the annual import total. Some indication of the undercounting in the detailed commodity statistics for imports is presented in the appendixes to the annual issues, from 1954–1965, of Bureau of the Census, Report FT 110, *United States Imports of Merchandise for Consumption*, and beginning 1967, Bureau of the Census, Report FT 135, *Imports, Commodity by Country*. Explanations of the sampling procedures are given in Report FT 110 for 1956; monthly issues of Report FT 135, *Foreign Commerce and Navigation of the United States, 1965*; and annual issues of *Guide to Foreign Trade Statistics*.

Export data are from Shippers' Export Declarations which exporters are required to file with customs officials for each shipment leaving the United States. Export data include shipments made after World War II under the Department of the Army Civilian Supply Program only for 1948 and subsequent years. In addition, export data include United States exports under the Lend-Lease, United Nations Relief and Rehabilitation Administration, Economic Cooperation Administration, Mutual Defense Assistance, and other mutual security programs. Shipments to U.S. Armed Forces for their own use are not included in export statistics for any period.

Export value figures are based on the selling price (or on the cost, if not sold) of the commodity shipped and include inland freight, insurance, and other charges to the U.S. place of export. Transportation and other costs beyond the United States port of exportation are excluded. The country of destination is defined as the country of ultimate destination or country where the merchandise is to be consumed, further processed, or manufactured. In the event the exporter does not have definite information as to the country of ultimate destination for a shipment, it is credited (for statistical purposes) to the country to which it is consigned.

Certain export commodity classifications were grouped for security reasons into special categories beginning with May 1949, with periodic amendments to include additional commodities. With the adoption of new security regulations, effective July 1950, the publication of the country of destination and customs district detail for the special category commodities and groups was discontinued. Effective January 1965, some changes were made in the security restrictions primarily because of revisions in export commodity classifications. Permission was granted to release data on exports of some commodities

which were previously classified as special category commodities with the result that security restrictions were applied to considerably fewer commodities than before. In addition, permission was granted to release some commodity data for 1964 and prior years, which was withheld when statistics for those years were initially released. Data for special category commodities are included, however, in all total export statistics, series U 187, U 190, U 191, U 213, U 225, U 226, and U 317; in the category of finished manufactures, series U 218, U 235, and U 236; and in the commodity categories of series U 274–294 (except automobiles and parts, series U 287, from which machinery and vehicles manufactured to military specifications have been excluded beginning in July 1949).

Shipments individually valued, prior to October 1969, at less than $100 and, thereafter, at $250 and under, are not classified by commodity, but are reported in a single separate category. Effective with the statistics for July 1953 and continuing through December 1955, data for export shipments individually valued from $100 to $499 (about 4 to 6 percent of the total export value) were estimated on the basis of a 10-percent sample. From January through June 1956, the 10-percent sample was applied to shipments individually valued from $100 to $999 but, subsequently, the level was reduced to the previous level of $499. From July 1956–December 1959, shipments valued $100–$499 were based on a 10-percent sample; from January 1960-December 1962, on a 10–percent sample for Canada and a 50-percent sample for other countries. From January 1963–September 1969, shipments to Canada valued $100–$1,999 were based on a 10-percent sample; shipments to other countries valued $100–$499 were based on a 50-percent sample. From October 1969–December 1969, shipments to Canada valued $251–$1,999 were based on a 10-percent sample; shipments to other countries valued $251–$499, on a 50–percent sample; from January 1970-August 1970, shipments to other countries valued $251–$499 were fully compiled. For Canadian shipments valued $251–$1,999, sampling procedures were applied. Effective September 1970, shipments to Canada valued $251–$1,999 were based on a 10-percent sample; shipments to other countries valued $251–$499 on a 50-percent sample. Value data for shipments less than $100, prior to October 1969, and less than $251 thereafter, were estimated each month from factors established by observation of the percentage relationship of the under-$251 (under $100 prior to October 1969) shipments to the individual country totals in past periods. Details concerning sampling error and procedures are given in the Bureau of the Census, *Quarterly Summary of Foreign Commerce of the United States*, January-December 1956; *Foreign Commerce and Navigation of the United States, 1965*; monthly issues of Report FT 410, *Exports, Schedule B Commodity by Country*; and annual issues of *Guide to Foreign Trade Statistics*.

The geographic area covered by these statistics, except as noted, is the United States customs area, which includes Alaska, Hawaii, and Puerto Rico, and for 1935–1939, the Virgin Islands.

U.S. Bureau of the Census, 1916–1941, *Statistical Abstract of the United States, 1948* edition, p. 939; 1942–1946, *1951* edition, p. 854; 1947–1965, *Foreign Commerce and Navigation of the United States, 1964* and *1965;* 1966–1970, *Statistical Abstract, 1972* edition, p. 788.

Merchandise export statistics include data on all shipments of commodities and merchandise leaving the United States customs area except: (*1*) Gold and silver (prior to 1968) and evidences of debt; (*2*) intransit merchandise; (*3*) bunker fuel, stores, supplies, and equipment for vessels and planes; (*4*) temporary exports; (*5*) merchandise having small value or no commercial value; (*6*) shipments of military and naval supplies and equipment to the U.S. Armed Forces; and (*7*) shipments of office equipment and related items to U.S. Government agencies or establishments.

Exports of U.S. merchandise, series U 191, consist of commodities grown, produced, or manufactured in the United States, and commodities of foreign origin which have been changed in the United States from the form in which they were imported, or which have been enhanced in value by further manufacture in the United States.

Reexports, series U 192, comprise withdrawals from customs-bonded storage warehouses for exportation and exports of foreign merchandise (principally duty-free articles) which have previously been formally entered through customs. Exports of foreign merchandise consist of commodities of foreign origin which have entered the United States as imports and which, at the time of exportation, are in the same condition as when imported.

Merchandise import statistics include data on all commodities and merchandise reaching the United States except: (*1*) Merchandise not entering the U.S. customs area, such as articles excluded from the United States by law; (*2*) bunker fuel, and ships' stores; (*3*) intransit merchandise; (*4*) certain domestic merchandise returned from foreign countries; (*5*) gold and silver (prior to 1968) and evidences of debt; (*6*) merchandise having small value or no commercial value; and (*7*) commodities entered under special provisions, such as articles consigned to diplomatic officers. General imports, series U 193, consist of entries for immediate consumption and entries into bonded warehouses, and therefore comprise the total arrivals of merchandise, whether they enter consumption channels immediately or are entered into warehouses under customs custody to be subsequently withdrawn for consumption or withdrawn for exportation. Imports for consumption are the total of the entries for immediate consumption and the withdrawals from warehouse for consumption. The terms "entered for immediate consumption" and "withdrawn from warehouse for consumption" are taken from the language used in handling the transactions through customs, and are sometimes misleading in their implication that the merchandise is immediately assimilated by being processed, merchandised, or consumed. Although all customs barriers to such assimilation have been removed, merchandise for "immediate consumption" may, in fact, be warehoused by the importer outside of customs custody. In the case of withdrawal for "consumption," although duties have been paid and the goods released from customs control, they may remain in storage for a further period of time. Any of this "for consumption" merchandise could conceivably be exported subsequent to its release from customs custody and thus never enter actual U.S. consumption channels.

U 197–200. Gold and silver exports and imports, 1821–1970.

Source: U.S. Bureau of Foreign and Domestic Commerce, 1821–1864, *Foreign Commerce and Navigation of the United States, 1912*, p. 43. U.S. Department of the Treasury, 1865–1880, *Statistical Abstract, 1887*, pp. 41, 42. U.S. Bureau of the Census, 1881–1941, see source for series U 187–189 above; 1942–1946, *Summary of Foreign Commerce of the United States*, various annual issues; 1947–1965, *Foreign Commerce and Navigation of the United States, 1964* and *1965;* 1966–1970, *U.S. Foreign Trade, Gold Movements*, FT 2402, December issues.

Prior to 1895, figures for gold and silver relate to coin and bullion only; subsequently, they include ore also. Domestic exports of gold and silver cannot be separately stated prior to 1864, but it is probable that the greater portion of the exports was gold. In the series shown here, the data on exports of gold prior to 1864 include domestic exports of silver. The exports of silver for years prior to 1864, therefore, consist of only foreign exports or reexports.

U 201–206. Foreign trade related to various measures of production, 1869–1970.

Source: **Series U 201–202**, 1869–1939, computed as the ratios respectively of series U 190 and U 193 to gross national product (using series F 1 for all years except 1909–1918; for these years, the estimates of gross national product are from U.S. Senate, 79th Congress, 1st session, "Report to the Committee on Banking and Currency," *Basic Facts on Employment and Production*, Senate Committee Print No. 4); 1940–1957, U.S. Bureau of Foreign Commerce, *Exports in Relation to United States Production, 1957*, p. 2; 1958–1962, U.S. Bureau of International Commerce, *Exports in Relation to U.S. Production, 1962*, Overseas Business Reports No. 63–118, p. 2; 1963–1970, ratios computed from foreign trade data, as published by BIC in *U.S. Foreign Trade Annual, 1966–1972*, Overseas Business Reports No. 73–12, p. 2, and gross national product data as published by U.S. Bureau of Economic Analysis in *Survey of Current Business*, July 1973, p. 52. **Series U 203–204**, 1919–1927, 1931, and 1935, U.S. Bureau of Foreign Commerce, *World Trade Information Service Statistical Reports*, part 3, No. 58–22; 1929, 1933, and 1937–1962, see source for series U 201–202, 1940–1957 and 1958–1962; 1963–1970, value of production corresponds to aggregate for agricultural production (U.S. Department of Agriculture, *Farm Income Situation*, No. 222, July 1973, table 29, and U.S. Bureau of Economic Analysis, *Survey of Current Business*, July 1973, p. 24), manufacturing (U.S. Bureau of the Census, *Annual Survey of Manufactures, 1971*, No. M71 (AS), p. 3), mineral production (U.S. Department of the Interior, *Statistical Summary—Minerals Yearbook*, 1972), and freight receipts (U.S. Interstate Commerce Commission, *Annual Report on Transport Statistics of the United States*). **Series U 205**, 1910–1950, U.S. Foreign Agricultural Service, *United States Farm Products in Foreign Trade*, Statistical Bulletin No. 112, p. 10; 1951–1955, *The Problem of Maintaining High Level Agricultural Exports*, November 1957, p. 13; 1956–1970, U.S. Bureau of Economic Analysis, *1971 Business Statistics*, biennial supplement to *Survey of Current Business*, p. 111, and U.S. Department of Agriculture, Economic Research Service, *Agricultural Statistics, 1972*, p. 562. **Series U 206**, Don D. Humphrey, *American Imports*, © 1955 by the Twentieth Century Fund, New York, pp. 527–528.

U 207–212. Value of merchandise imports and duties, 1821–1970.

Source: See source for series U 193–195.

Imports are "imports for consumption" consisting of entries for immediate consumption and withdrawals from warehouses for consumption. The term "entry for consumption" is the technical name of the import entry made at the customhouse, and implies that the goods have been delivered into the custody of the importer and that the duties have been paid on the dutiable portion. Some of them may be exported afterwards.

For 1821–1866, the figures for import values, series U 207–209, represent net general imports (total imports less reexports), the amount of duty collected (calculated) being the annual amounts collected on merchandise only. For 1867–1970, the figures of import values represent imports entered for consumption.

U 210, duties calculated. The series described here as "duties calculated" is the series identified in annual volumes of *Foreign Commerce and Navigation . . .*, through the 1925 issue, as "duties collected"; subsequent issues describe it as "duties calculated." In spite of its description, it was a computed figure at least back to 1876. The evidence indicates that the earlier years, at least in part, were on a "duties collected" basis. This series should not be confused with the modern series called "duties collected" (not shown here) which represents the total amount of duties actually collected (on individual shipments) as reported to the Treasury Department by customs officials, subject in certain cases to subsequent refund as well as drawback. In contrast, "duties calculated" is a statistical measure derived by applying the appropriate rates to totals for all imports of the given commodity received at all ports of entry; it does not reflect drawbacks or refunds and is subject to some time lag in reporting.

U 211–212, ratio of duties to total. The calculated ratio of duties to total is simply the relationship of series U 210 to series U 207 and series U 209, respectively, expressed in percentage form. Series U 211–212 are similar to, but not identical with, the series described as "ratios of duties to total" shown in annual issues of *Foreign Commerce and Navigation . . .*, 1925 to 1946, and as "*average ad valorem rates*" in earlier issues. These series have been computed as shown here because of conflicts in source volumes with respect to early years.

U 213–224. Value of merchandise exports and imports, by economic class, 1820–1970.

Source: U.S. Bureau of the Census. 1820–1918, *Statistical Abstract of the United States*, 1820–1881, *1907* edition, pp. 698–701; 1882–1903, *1926* edition, pp. 448, 449; 1904–1918, *1947* edition, pp. 896, 897. 1919–1970, *Indexes of U.S. Exports and Imports by Economic Class: 1919 to 1971*, tables 1 and 5.

For definition of terms, see text for series U 190–196, U 207–212, and U 225–248.

The economic classes shown here are broad categories based on groupings of more than 2,000 individual commodities listed in *Schedule B: Statistical Classification of Domestic and Foreign Commodities Exported From the United States*, issued and kept current by the Bureau of the Census. Following are some of the important and typical commodities included in each of the economic classes:

Class	*Exports*	*Imports*
Crude materials	Crude petroleum	Crude rubber
	Coal	Raw silk
	Raw cotton	Hides and skins
Crude foodstuffs	Grains	Coffee
	Fruits	Tea
	Vegetables	Fruits
Manufactured foodstuffs	Meat	Sugar
	Lard	Meat
	Prepared fruits	Wheat flour
Semimanufactures	Iron and steel plates	Wood pulp
	Lumber	Copper in bars, etc.
	Refined copper	Tin in bars, etc.
Finished manufactures	Aircraft	Wool manufactures
	Cigarettes	Newsprint
	Radios and television sets	Automobiles and parts

In a report on *Exports of Manufactures From the United States and Their Distribution by Articles and Countries, 1800–1906* (1907), the Department of Commerce and Labor presented trade figures by economic classes annually back to 1850 and for selected years back to

1820. This study provided a different grouping of commodities than the Bureau of Statistics of the Treasury Department had previously employed for exports. In "Exports of Domestic Manufactures and Their Distribution" (*Monthly Summary of Commerce and Finance of the United States*, April 1903, p. 3239 ff.) the Treasury tabulated domestic exports for 1800–1850 by decade years and for 1851–1902 annually according to economic sector ("sources of production") as follows (p. 3249): Agriculture, manufactures, mining, forest, fisheries, and miscellaneous. But it tabulated imports "according to degree of manufacture and uses" for 1821, 1830, 1840, 1850, and 1851–1902 as follows (p. 3279–3280): Food and live animals, crude articles for domestic industries, articles manufactured wholly or partially for use as material in the mechanic arts, articles manufactured ready for consumption, and articles of voluntary use, luxuries, etc. This report noted that values for exports were in fluctuating currency for 1862–1879 and for those years gave specie values both for total exports and for exports of manufactures (p. 3315).

Trade in agricultural and forest products have been of special concern to the Department of Agriculture. Bulletin No. 51 of the Bureau of Statistics of the Department of Agriculture (1909) provides the "only compilation . . . ever to be completed (to that time)" of the "Foreign Trade of the United States in Forest Products, 1851–1908." Bulletins No. 74 and 75 in the same series, published in 1910, reviewed the "Imports of Farm Products Into the United States, 1851–1908" and "Exports of Farm Products From the United States, 1851–1908," respectively.

U 225–248. Indexes of quantity and unit value of exports and imports, by economic class, 1879–1970.

Source: 1879–1921 (1913 =100 base), Robert E. Lipsey, *Price and Quantity Trends in the Foreign Trade of the United States*, Princeton University Press for the National Bureau of Economic Research, 1963 (copyright); U.S. Bureau of International Commerce, 1913 (1967 = 100 base), unpublished data; 1919–1970 (1967 = 100 base), *Indexes of U.S. Exports and Imports by Economic Class: 1919–1971*.

The Bureau of International Commerce indexes are computed by the Fisher formula, chained annually so that weights are taken from the given and preceding years. Commodities not directly entering into the calculations are taken into account in the weighting within the economic classes on the basis of certain assumptions regarding similarity of their price movements to price changes of commodities specifically covered.

The National Bureau of Economic Research indexes for the years 1879–1921 also used the Fisher formula linked from four time segments, within each of which weights are taken from the given year and the latest year of the segment. The National Bureau supplemented the U.S. foreign trade data with price information from other sources.

Descriptions of methods used for the two sets of indexes are available in the sources.

All commodities in U.S. export and import trade have been grouped into one of five economic classes as follows: (1) Crude foods—products for edible use (by man or animals) which have not been substantially processed after sale by the farmer, fisherman, rancher, or other primary producer; (2) manufactured foods—processed forms of crude foods, edible and refined oils, and oilcake and meal; (3) crude materials—products of farms, forests, fisheries, and mines which are for nonfood use and which are unprocessed by manufacturing; (4) semimanufactures—manufactured materials in the early stages of processing; and (5) finished manufactures—highly processed bulk materials and products manufactured from semimanufactures or other finished products.

U 249–263. Value of exports and imports, by broad end-use class, 1923–1970.

Source: 1923–1967 (excluding World War II years), U.S. Office of Business Economics, *U.S. Exports and Imports Classified by OBE End-Use Commodity Categories, 1923–1968*, tables 1 and 2; 1968–1970, U.S. Bureau of Economic Analysis (formerly Office of Business Economics), *Survey of Current Business*, March issues.

The Bureau of Economic Analysis (BEA), (formerly Office of Business Economics (OBE)) end-use series presented in series U 249–263 are constructed from basic data provided by the Bureau of the Census, which has primary responsibility for compiling the official statistics of U.S. merchandise exports and imports. The Census Bureau currently collects foreign trade data on the basis of some 14,000 individual commodity numbers which are contained in its commodity classification schedules: almost 4,000 in Schedule B, for exports; over 10,000 in the Tariff Schedules of the United States Annotated (TSUSA), for imports.

BEA's-OBE's end-use categories are constructed by assigning each of these 14,000 basic "building blocks" to one of 228 basic end-use commodity groupings—116 for exports and 112 for imports—each of which is identified by a 4-digit code number. These 4-digit commodity groupings aggregate into broader intermediate groupings, identified by 3-digit and 2-digit codes. The intermediate groupings, in turn, combine at the broadest level into the principal 1-digit end-use categories—7 for exports, 6 for imports, as shown in series U 249–263.

BEA's-OBE's classification scheme was designed to fill a gap in the presentation of foreign trade statistics by regrouping commodity exports and imports as compiled by the Bureau of the Census into new, broad commodity categories based on a concept of end-use demand. The data have customarily been classified in terms of the physical nature of commodities and their stage of processing, or in terms of the principal industries *producing* the commodities. The end-use classification is associated with the principal sectors of the economy *using or consuming* the commodities.

It should be noted that inasmuch as the BEA-OBE end-use categories are constructed from the Census Bureau's Schedule B (export) and TSUSA (import) classifications, the validity of the assignments of individual commodities to end-use categories is subject to the limitations of the census classifications systems. The 14,000 basic "individual" commodities classified in Schedule B and TSUSA very frequently represent not a single commodity but rather a number of different items not separately classified. These items are related by their material content or general function, but not necessarily by their end-use. This is especially true of "basket" classifications. For example, "rubber products, n.e.s." may include erasers and soap dishes for consumer use, as well as rubber flanges, rings, and valves for industrial use. In cases of this kind, the products deemed to comprise most of the value of the "basket" commodity—based on advice of foreign trade commodity specialists—determine the end-use assignment it will receive. In another case, the commodity "ball bearings" is a machinery part that has been assigned to the export end-use category "Capital goods, except automotive" even though it includes ball bearings for autos and trucks which would be assigned, if they were separately identifiable, to the end-use category "Automotive vehicles, parts, and engines."

U 250 and U 258, foods, feeds, and beverages. This category is comprised of food for human consumption and animal feeds, and includes edible animals. It excludes work animals and animals for breeding, which are included in "Materials associated with nondurable goods and farm output," a grouping within the industrial supplies and materials category. Tobacco is not included in the foods category: cigarettes, etc., are in the consumer goods (nonfood) category, while unmanufactured tobacco is considered to be an industrial material (used in the manufacture of cigarettes and other tobacco products). A distinction is made in the foods category between *agricultural* and *nonagricultural* commodities in exports, but not in imports. This category, unlike the other principal end-use categories, does not distinguish between *manufactured* and *unmanufactured* commodity classes in either exports or imports.

U 251 and U 259, industrial supplies and materials. This category encompasses crude and processed materials and supplies primarily associated with, or used in, the producing sectors of the economy—

manufacturing, farming, and construction. Both the export and import sides are set up so as to separate *manufactured* from *unmanufactured* goods. *Agricultural* and *nonagricultural* aggregates can be obtained for exports but not for imports.

The industrial supplies and materials end-use category is subdivided on the import side into five major intermediate groupings as follows: (1) Fuels and lubricants; (2) paper and paper base stocks; (3) materials associated with nondurable goods and farm output; (4) selected building materials, except metals; (5) materials associated with durable goods output. These aggregates were established in order to facilitate analysis of the relationships between domestic economic conditions and imports of industrial supplies and materials. For example, shifts in imports of materials associated with durable goods output can be examined for their relationship to changes in the Federal Reserve Board's production index of durable manufactures, and imports of selected building materials can be related to domestic construction and housing indicators.

On the export side, the industrial supplies and materials category is broken down between agricultural and nonagricultural goods; intermediate groupings similar to (3), (4), and (5), listed above, are not constructed.

(1) *Fuels and lubricants*—comprised of coal, oil, and gas. This grouping excludes petrochemicals, which are included with chemicals in another grouping within the industrial supplies and materials category. Although fuels and lubricants are partly associated with consumer goods as well as industrial supplies, it was not considered feasible to try to distinguish between fuel for home heating, for example, and fuel for industrial heating and energy.

Fuels and lubricants have been established as an independent major subcomponent of the industrial supplies and materials category on both the export and import sides because of their magnitude in our international trade, and because of the difficulty of associating them with the output of nondurable as distinguished from durable goods.

(2) *Paper and paper base stocks*—consists of pulpwood, woodpulp, and scrap materials for making paper; also paper products, mainly newsprint, but including also kraft paper, paperboard, and similar products. Excluded are such paper products as stationery, which are allocated to the consumer goods end-use category. The predominance of newsprint imports in the paper grouping, and the unique nature of this product, led to the establishment of paper, like the fuels and lubricants grouping, as a separate major subcomponent of industrial supplies and materials for both exports and imports.

(3) *Materials associated with nondurable goods and farm output*—consists of supplies and materials related to the manufacture of products considered to be *nondurables.* It includes such goods as crude and processed textiles, but not those manufactured into final products such as apparel and house-furnishings. The latter are in the consumer goods category. Also included are unmanufactured tobacco, chemicals (except medicinals), hides and skins, undressed furs, soap and perfumery ingredients, etc. Seeds, fertilizers, farm work animals and breeding animals, and eggs for hatching are included as materials associated with farm output. This grouping is constructed only for imports.

(4) *Selected building materials, except metals*—consists of such major (nonmetal) building materials as lumber, plywood and veneers, stone, sand, cement, lime, glass (except automotive), asbestos, gypsum, millwork, molding, prefabricated structures, etc. Excludes metals used in building (steel beams, copper tubing, wire, pipe, latches and locks, etc.). This grouping is constructed only for imports.

(5) *Materials associated with durable goods output*—consists of supplies and materials related to the manufacture of products defined to be *durables.* Includes primary metals and metal shapes, and fabricated metal manufactures for further assembly or incorporation in other goods (door hinges, latches, locks, and parts and components not included elsewhere). This grouping is constructed only for imports.

It should be noted that the allocation of individual commodities to the various subcomponents outlined above is based on end-use demand and not on the nature of the commodities from a production (supply) viewpoint. To illustrate—imports of primary rubber, a "nondurable" commodity, is classified under "Materials associated with durable goods output" because its major end-use—as a tire-making material—is associated with the production of such durable goods as motor vehicles (including tractors), and aircraft.

U 252 and **U 260,** capital goods, except automotive. This end-use category is designed to include all (nonmilitary) machinery, equipment, apparatus, and instruments—and their parts, components, accessories, and attachments. These products are associated with investment outlays for industrial and agricultural plant and equipment; for commercial, scientific, professional, and service-industry capital goods; and for natural resource development (petroleum and mining), and construction. Also included is transport equipment such as civilian aircraft and parts, railway rolling stock, and, for exports only, commercial cargo and passenger-carrying vessels. Automotive products are *excluded* from the capital goods end-use category as are other transportation items classifiable as consumer goods (yachts and other pleasure craft, motorcycles, etc.).

U 253 and **U 261,** automotive vehicles, parts, and engines. This category contains commodities that might have qualified for assignment to two other end-use categories; passenger cars and parts to consumer goods (nonfood), and trucks and buses and parts to capital goods. However, because it has not been possible to distinguish parts for passenger cars from parts for trucks and buses, and because of the overall magnitude and importance of U.S. automotive trade, a separate automotive category was established. There are groupings within the category for passenger cars, trucks and buses, and automotive parts and engines (including engine parts).

U 254 and **U 262,** consumer goods (nonfood), except automotive. Designed to cover products used by the final consumer, this category has been subdivided into *durables* and *nondurables,* as well as *manufactured* and *unmanufactured.* The overall category encompasses a broad variety of products including consumer-type transportation equipment other than automotive—pleasure craft, motorcycles, etc.—and furniture, rugs, appliances, radios and TV, clocks and watches, precious stones, and other *durables;* and apparel and household softgoods, leather, rubber and plastic articles, notions and toiletries, medicinal preparations, and other *nondurables.* In general, consumer goods have been classified as *durables* or *nondurables* on the basis of whether they are, respectively, *hardgoods* or *softgoods.* Rugs are an exception, being classified as durable goods because of their long life and relatively high cost, and because they can be characterized as consumer "capital goods" along with furniture and appliances. The consumer goods category consists predominantly of manufactured products, but also includes such unmanufactured items as gem stones, Christmas trees, nursery stock, and pet birds.

U 255, special category, domestic (military-type goods). This is an export category only. It includes military aircraft, engines, turbines, missiles and rockets, military trucks, warships, ordnance, and other military material classified confidential by the Department of Defense as to country of destination. (Prior to 1965, DOD classified many military items confidential as to their identity as well as their destination.) A few other military items currently of minor value, not classified as special category—military cars and buses—are included in the category "Exports not elsewhere classified."

Parts for aircraft (exports) are not separately identifiable from 1958 on as between military and civilian aircraft, and all aircraft parts have thus been included, with civilian aircraft, in the capital goods category.

Imports of military aircraft and parts are included in the category "Imports not elsewhere shown." Other military imports are either minimal in value or are unidentifiable, and are included, as appropriate, in other end-use categories.

U 256 and U 263, exports, n.e.c., and imports, n.e.s. This category includes transactions and commodities not elsewhere classified or shown. "Exports, n.e.c." includes reexports (exports of foreign merchandise imported into the United States and then reexported with no significant change in form or content), low-value shipments (commodity detail unavailable), a few military items not classified as special category, and special transactions such as goods imported for repair and exported. "Imports, n.e.s." includes low-value shipments, U.S. goods returned (after having been exported), U.S. Government purchases of uranium ores and oxides, and of military aircraft and parts; also includes movies, exhibits, and laboratory, zoo, and show animals, etc. (Exports of uranium, and non-Government imports of uranium, are included in the industrial supplies and materials category.)

U 264–273. Value of merchandise exports and imports, by groups of customs districts, 1860–1970.

Source: U.S. Bureau of the Census, 1860–1880, *Statistical Abstract of the United States, 1923* edition, pp. 824–825; 1881–1903, *1924* edition, p. 441; 1904–1944, *1947* edition, p. 921; 1945–1970, unpublished data. Data are published for individual customs districts in Bureau of the Census, *Foreign Commerce and Navigation of the United States* and *Highlights of Exports and Imports*, FT 990.

The customs district in which merchandise is entered or withdrawn for consumption is the district shown in the "imports for consumption" statistics. The customs district shown in the "general imports" statistics is the district through which merchandise enters the United States either as an entry for immediate consumption or as an entry into a customs-bonded warehouse. Except for shipments by mail, vessels under their own power or afloat, and certain low-valued shipments, the customs district through which a shipment clears when it leaves the country is the district to which the export is credited statistically. Shipments are not credited on the basis of the district in which export shipments originate or to which import shipments are destined. For definition of terms, see text for series U 190–196 and U 207–212. Export figures for 1865 and 1870–1878 represent mixed gold and currency values and hence do not agree with the specie values given for total exports elsewhere.

U 274–316. General note.

The totals of the selected imports and exports, series U 274 and U 295, are shown to provide a means of judging the extent to which the selected items account for the total trade of this country. They include only the values of the items shown for each year and are, therefore, a total with a variable composition. Additional information on the composition of the foreign trade of the United States may be found in M. B. Hammond, *The Cotton Industry*, American Economic Association Series 2, No. 1, New York, 1897, and in reports by the U.S. Department of Treasury, Bureau of Statistics, on the grain, provision, cotton, coal, iron and steel, and lumber trades of the United States which appeared in the *Monthly Summary of Commerce and Finance* (hereafter abbreviated as *MSCF*) for 1899–1900, 1900–1901, and 1902–1903.

Export commodity information is compiled in accordance with the classifications in Schedule B, Statistical Classification of Domestic and Foreign Commodities Exported From the United States. For earlier years Schedule B, Statistical Classification of Domestic Commodities Exported From the United States, and Schedule F, Statistical Classification of Foreign Commodities Exported From the United States, were used. Export commodity information has been compiled in accordance with the Schedule B classifications in effect during those years. Commodities were classified according to physical characteristics or use. These groupings were made on the basis of the materials of which articles were made, the use for which they were intended, and the extent of their refinement or manufacture. In 1965, a revised edition of Schedule B based on the Standard International Trade Classification, Revised (SITC), was put in effect. The 1965 edition was developed with the primary objective of instituting a classification system providing for those detailed characteristics which permit comparison of the U.S. export statistics with foreign trade statistics of other countries reporting in terms of SITC, as well as data on domestic production. The statistics shown for 1960–1964, which were initially compiled in accordance with the Schedule B classifications in effect during those years, have been recompiled in terms of SITC classifications. It should be noted that some difficulties were encountered in relating the Schedule B classifications to the SITC and, because of differences between these two classification systems, it was necessary to assign some Schedule B numbers to SITC groups on the basis of judgment. Therefore, comparisons of 1960–1970 data for SITC groups with corresponding data for prior periods should be made with caution.

For periods prior to 1963, import commodity information was compiled in terms of the commodity classifications contained in Schedule A, Statistical Classifications of Commodities Imported Into the United States. Effective with the statistics for 1963, import data are compiled in accordance with the classifications in the Tariff Schedules of the United States Annotated (TSUSA), an official publication of the U.S. Tariff Commission embracing the legal text of the Tariff Schedules of the United States (enacted into law by the Tariff Classification Act of 1962) together with statistical annotations.

Effective with the statistics for 1964, a revised Schedule A classification system was established, based on the Standard International Trade Classification, Revised (SITC). This edition of Schedule A was constructed (1) to provide for the summarization of data for the approximately 10,000 TSUSA classifications into about 2,300 commodity groupings that are meaningful in terms of commodities important in the U.S. import trade and (2) to provide data in terms of the SITC outline that are comparable, insofar as comparison is possible, to the foreign trade statistics compiled by other trading nations.

As with export commodity statistics, difficulties were encountered in relating Schedule A classifications to TSUSA and SITC classifications; therefore, comparisons between 1963–1970 data and prior periods should be made with caution.

U 317–352. General note.

Imports are shown according to country of origin and exports according to ultimate destination. When the final destination is not known the shipment is credited statistically to the country to which it is consigned. Accurate information on country of origin is difficult to obtain. Consequently, the directional breakdown of foreign trade is at best approximate.

Trade with Canada and the United Kingdom, particularly, is difficult to measure. Considerable U.S. merchandise normally moves to foreign destinations via Canada and some moves across Canada to destinations in the United States, notably from ports in Michigan to ports in New York. At times such movements have been counted as trade with Canada. Also, considerable Canadian trade with other countries moves through the United States. A good deal of United States merchandise has been consigned to the United Kingdom and reexported to other markets by the United Kingdom, as can be observed by the difference between general imports and retained imports in the United Kingdom's record of trade with the United States.

Special studies of U.S.-Canadian trade have been made from time to time. In this connection, see the headnote to the table, p. 295 of *Commerce Yearbook,* vol. II, for 1931; and see *MSCF,* June and July 1898, pp. 2084–2089, where it is also noted (p. 2075) that "exports to Canada are incomplete prior to April 1, 1893, the date on which the law requiring exporters to clear their goods exported by railways went into effect." For an effort at adjusting the U.S. trade record for this deficiency and the similar lack of coverage in the report of trade with Mexico, see tables 2 and 3 of Matthew Simon's "The United States Balance of Payments, 1861–1900" published by the National Bureau of Economic Research in *Studies in Income and Wealth,* vol. 24, 1960. For a discussion of shortcomings in the U.S. record of trade with the United Kingdom in the early years of the Civil War, see the Treasury's report in 1864 to Congress, *Statistics of the Foreign and Domestic Commerce of the United States,* p. 37 ff.

For certain periods, like the Civil War and the greenback era, partners' records of trade with the United States are more reliable than the U.S. record and in some ways more revealing of certain aspects of the trade.

For 1862–1879, exports of domestic merchandise are mixed gold and currency values. Imports and reexports, however, are specie values. The extent of the adjustment can be observed by comparing figures from series U 317 with those in series U 190.

Prior to 1873, trade figures for Canada are actually trade figures for all of British North America, a somewhat larger area than the Dominion of Canada. Asia includes the Philippines in all years and Turkey in Europe for 1926–1951. Oceania includes Hawaii prior to 1901. Europe includes the Soviet Republic in Asia since 1923 and Iceland in all years (Iceland was included with northern North America in *Historical Statistics of the United States, 1789–1945*).

The source for these series for 1821–1881 is the Treasury Department, Bureau of Statistics, *Monthly Summary of Commerce and Finance,* hereafter abbreviated as *MSCF.*

NA Not available. Z Less than $500,000 or less than −$500,000.

[1] Includes gold and silver prior to 1821. Beginning 1961, includes exports and imports of uranium, thorium, and related products; beginning 1968, includes silver ore and bullion.

[2] Prior to 1864, domestic exports of silver included with gold.

[3] Beginning 1968, silver ore and bullion included in merchandise exports and imports.

[4] Figures which include estimates of civilian supplies shipped to occupied areas through U.S. Armed Forces and other relief agencies are as follows (in millions of dollars): 1944, 14,414; 1945, 10,530; 1946, 10,184; 1947, 15,338.

[5] Does not add due to revisions not carried to detail.

[6] Figures for 6-month period July 1, 1915–Dec. 31, 1915, are as follows (in millions of dollars): Series U 187, 1,905; series U 188, 1,239; series U 189, +667; series U 190, 1,853; series U 191, 1,820; series U 192, 33; series U 193, 913; series U 196, +940; series U 197, 24; series U 198, 307; series U 199, 29; and series U 200, 19.

[7] Period beginning Oct. 1, 1842, and ending June 30, 1843.

[8] Data shown under silver are for gold and silver.

Series U 201–206. Foreign Trade Related to Various Measures of Production: 1869 to 1970

[1] Trade data cover U.S. customs area, which includes Alaska, Hawaii, and Puerto Rico for all years; gross national product data include Alaska and Hawaii beginning 1959; measures of production used for estimates of movable goods exclude Alaska and Hawaii except output of minerals are included beginning 1953 and value added in manufacturing beginning 1958.

[2] Excludes Alaska and Hawaii for all years.

[3] Includes an estimate for civilian supplies shipped to occupied areas through U.S. Armed Forces, which were not tabulated with the foreign trade statistics prior to 1947.

[4] For an explanation of this concept, see text for series F 1–5 and F 71–97.

Series U 207–212. Value of Merchandise Imports and Duties: 1821 to 1970

[Merchandise imports entered for consumption. For years ending September 30, 1821–1842; June 30, 1843–1915; thereafter, calendar years]

Year	Value of imports for consumption [1]			Duties calculated	Ratio of duties calculated to total imports		Year	Value of imports for consumption			Duties calculated	Ratio of duties calculated to total imports

[1] Beginning 1961, includes uranium, thorium, and related products; beginning 1968, includes silver ore and bullion.

[2] Figures for 6-month period July 1, 1915–Dec. 31, 1915, are as follows (in millions of dollars): Series U 207, 935; series U 208, 631; series U 209, 303; series U 210, 96; series U 211, 10.26 percent; and series U 212, 31.61 percent.

[3] Agrees with source; however, figures for components do not add to total shown.

[4] During the period May 1, 1900–July 25, 1901, merchandise brought from Puerto Rico was dutiable at 15 percent of regular rates. The duties collected thereon were as follows: May 1, 1900–June 30, 1900, $134,593.88; July 1, 1900–July 25, 1901, $448,193.91.

[5] Period beginning Oct. 1, 1842, and ending June 30, 1843.

Series U 213–224. Value of Merchandise Exports and Imports, by Economic Class: 1820 to 1970

[In millions of dollars. General imports through 1933; thereafter, imports for consumption. For years ending September 30, 1821–1840; June 30, 1850–1915; thereafter, calendar years. Excludes trade in silver prior to 1947 and military grant-aid beginning 1950]

[1] Includes beverages.

[2] Beginning 1950, for security reasons, a small amount of semimanufactures included with finished manufactures.

[3] Imports for consumption are as follows (in millions of dollars): Series U 219, 1,433; series U 220, 420; series U 221, 215; series U 222, 191; series U 223, 290; and series U 224, 317.

[4] Figures for 6-month period July 1, 1915–Dec. 31, 1915, are as follows (in millions of dollars): Series U 213, 1,820; series U 214, 303; series U 215, 158; series U 216, 293; series U 217, 268; series U 218, 799; series, U 219, 913; series U 220, 378; series U 221, 130; series U 222, 113; series U 223, 144; and series U 224, 147.

[5] Excludes exports from San Francisco valued at $1,343,064.

Series U 225–248. Indexes of Quantity and Unit Value of Exports and Imports, by Economic Class: 1879 to 1970

Z Less than $500,000.

[1] Beginning 1946, includes exports and imports of silver ore and bullion.

[2] To achieve time series comparability, adjustments have been made to the census data for 1946–1959 to include U.S. Government imports of uranium ores, concentrates, and oxides which are excluded from Census data for these years.

[3] For 1933–1940, includes differences between total imports, which are on a "general imports" basis, and the sum total of the commodity categories, which are on an "imports for consumption" basis.

[4] For 1946, excludes an estimated $499 million of civilian supplies, mainly foodstuffs, shipped to occupied areas. Beginning 1947, similar civilian supply shipments are included.

Series U 264–273. Value of Merchandise Exports and Imports, by Groups of Customs Districts: 1860 to 1970

[In millions of dollars. Exports include reexports; general imports through 1933; thereafter, imports for consumption. For years ending June 30, 1860–1915; thereafter, calendar years]

NA Not available. Z Less than one-half the unit indicated.

[1] Where both are available, total includes "Wheat and wheat flour, value" but not "Wheat."

[2] Prior to 1865, quantity in hogsheads. Includes some leaf tobacco which has been partly processed.

[3] Includes semimanufactures.

[4] Includes margarine of vegetable origin since 1948. Excludes inedible fish oils. Excludes lard compounds since 1921; now classified as vegetable cooking fats.

[5] Includes fruit and nut preparations since 1946.

[6] 1855–1881, "Meats and meat products"; 1882–1904, "Meats."

[7] "Cars, carriages, automobiles, etc.," prior to 1902. Excludes machinery and vehicles manufactured to military specifications beginning July 1949.

[8] Includes box, crate, and package shooks (except fruit and vegetables) beginning 1949; classified as "Sawmill products" in prior years. Prior to 1881, "Sawmill products" combined with "Other wood manufactures."

[9] "Coal and coke" prior to 1946.

[10] Includes a small amount of nonferrous metal articles.

[11] No record of cotton exports for southern ports.

[12] For 9 months.

Series U 295–316. Imports of Selected Products: 1790 to 1970

[In millions of dollars and units. For years ending September 30, 1790–1842; June 30, 1843–1915; thereafter, calendar years. Last 6 months of 1915 omitted]

NA Not available. Z Less than one-half the unit of measure indicated.

[1] Includes semimanufactures.

[2] Copper including ore and manufactures since 1946.

[3] Includes fur hats beginning 1921; formerly classified as miscellaneous textile products.

[4] Includes sawmill products, wood pulp, and paper and manufactures.

[5] Value in millions of dollars for imports for consumption as follows: Series U 302, 19; series U 303, 16; series U 307, 51; series U 308, 31; series U 309, 15; series U 310, 45; series U 313, 37; series U 314, 37; series U 315, 144; series U 316, 26.

[6] For 9 months.

Series U 317–334. Value of Exports (Including Reexports) of U.S. Merchandise, by Country of Destination: 1790 to 1970

[**In millions of dollars.** Figures shown here are mixed values for 1862–1879. For years ending September 30, 1790–1842; June 30, 1843–1915; thereafter, calendar years. Beginning 1961, includes uranium, thorium, and related products. Beginning 1869, includes silver ores, base bullion, and refined bullion]

														1790	20	13	7	1	(Z)	5

– Represents zero. Z Less than $500,000.

[1] For security reasons, exports of special category commodities are excluded from totals for certain countries. Beginning 1950, exports reflect declassification of special category data authorized July 28, 1965 and January 5, 1968, and relaxation of security restrictions as authorized July 17, 1969.

[2] Prior to 1873, data are for trade with British North American Provinces which is a somewhat larger area than the Dominion of Canada. In the year ending June 30, 1873, the U.S. traded with British North American Provinces the following amounts: Exports, $34.6 million and imports, $37.6 million. Beginning 1950, includes Newfoundland and Labrador.

[3] Prior to January 1952, East and West Germany; thereafter, only West Germany.

[4] Figures in italics include gold and silver.

[5] Beginning 1954, excludes Ryukyu Islands. No records available prior to 1855.

[6] Includes Puerto Rico.

[7] For 9 months.

Series U 335–352. Value of General Imports, by Country of Origin: 1790 to 1970

[In millions of dollars. Totals shown here in mixed values. For years ending September 30, 1790–1842; June 30, 1843–1915; thereafter, calendar years. Beginning 1961, includes uranium, thorium, and related products]

Z Less than $500,000.

[1] Beginning 1962, includes data on imports from countries which could not be identified because of illegible reporting on import entries for low valued shipments not included in the detail figures.

[2] Prior to 1873, data are for trade with British North American Provinces which is a somewhat larger area than the Dominion of Canada. In the year ending June 30, 1873, the U.S. traded with British North American Provinces the following amounts: Exports, $34.6 million and imports, $37.6 million. Beginning 1947, includes Newfoundland and Labrador.

[3] Prior to January 1952, East and West Germany; thereafter, only West Germany.

[4] Figures in italics include gold and silver.

[5] Beginning 1954, excludes Ryukyu Islands. No records available prior to 1855.

[6] Agrees with source; however, figures for components do not add to total shown.

[7] For 9 months.

Chapter V

Business Enterprise

Business Population (Series V 1-107)

V 1–107. General note.

Statistics on the total number and the size distribution of business firms must be used with caution. No governmental process records all firms, and an entirely satisfactory definition of a firm seems impossible. The boundary between self-employment and conduct of a business firm is hazy at best. In addition, there are problems of inactive or partly (e.g., seasonally) inactive firms, joint ventures, partial interests, ownership of multiple firms by individuals and families, etc. Moreover, the characteristic which causes an enterprise to be counted as, for example, a corporation, an employer subject to social security, or an operator of an establishment requiring a sanitary or safety license, varies with laws creating these categories and with degree of thoroughness of administration of these laws.

These difficulties are compounded when an attempt is made to group firms into industrial categories, because industry boundaries must be arbitrary, and the assignment of a firm on one side of the boundary or another may be based on a 50-percent rule or on some convention lacking analytic justification. Or the activity may not fit well into any recognized category.

The statistical importance of these problems is great because of the unusual size distribution of the business population, which contains a large number of very small firms, and a minute proportion of larger firms accounting for a substantial or even predominant fraction of total activity. Many small firms are on the boundary line between recognition and nonrecognition (enumeration or nonenumeration), so that a slight difference in method or source, particularly one of which the statistician is unaware, may generate considerable but spurious change or absence of change in the total number of firms. If, however, the object of estimation is not number of firms but total activity, the radically unequal size distribution becomes a great advantage because it permits more efficient sample design at lower cost.

The number and percentage of business firms, therefore, must be used with a realization that the meaning of a business firm is not always certain and that the figures are subject to considerable error. The most meaningful statistics of the business population are those which are based on some consistent criterion or definition over a period of years. The business population studies of the U.S. Bureau of Economic Analysis may be said to have inaugurated the publication of such satisfactory statistics.

The record of one particular year's activity is in effect a single observation out of the infinite number which might be generated by the structural condition which is the object of measurement. Strikes, accidents, and cyclical fluctuations, with highly unequal impact upon various branches of industry, cause a divergence of the actual year's activity from the theoretically true or representative (average) year. Furthermore, if the incidence of mergers (series V 38–39) is substantial, a given year may be the peak or trough of a short-run change in concentration. Moreover, concentration measures may be strongly affected by the arbitrary nature of industry subdivisions, changes in industry classification between census years, and turnover of companies among those designated as the largest.

V 1–12. Proprietorships, partnerships, and corporations—Number, receipts, and profit, 1939–1970.

Source: U.S. Internal Revenue Service. *Statistics of Income, Business Income Tax Returns, 1965* and *1968* issues; *Statistics of Income, Individual Income Tax Returns* and *Statistics of Income, Corporation Income Tax Returns*, various issues; and unpublished data.

Proprietorships, partnerships, and corporations encompass virtually all American businesses except those reported to the Internal Revenue Service by fiduciary agents of estates and trusts and the business activities of "exempt" organizations.

"Proprietor" applies to anyone with income from a single-owner business who had specified minimums of self-employment income or gross income during the year. (For historical details, see *Statistics of Income, Individual Income Tax Returns, 1965*, p. 206.) Thus, the proprietorship data cover the farmers, businessmen, and professionals who are in business for themselves on a full-time or part-time basis. Generally, a proprietor corresponds to a "self-employed" person, other than partners. However, some types of persons defined as self-employed in the Internal Revenue Code are not considered as businessmen in the tax returns report. The most important of these are clergymen and public officials, such as sheriffs, notaries public, etc. Often, classification of a person as a proprietor depended entirely on how he reported his income.

"Partnership" applies to any group of two or more persons conducting a business for profit unless it is specifically classified as a corporation for tax purposes.

"Corporation" includes most businesses incorporated under State law and, in addition, many unincorporated associations, such as mutual insurance societies, savings and loan associations, and real estate investment trusts.

V 1, V 4, V 7, and **V 10,** number of business organizations. Represents the number of active businesses operated as proprietorships by individuals, the number of active partnerships, and, for corporations, the number of active corporation tax returns filed, including those for small business corporations. The total number of corporations is slightly understated to the extent that subsidiary corporations are included in a consolidated return filed by a parent corporation.

V 5–6, business receipts and net profit (less loss) for proprietorships. In general, series V 5 represents gross receipts from sales and operations reduced by the cost of returned goods and allowances. Receipts include incidental income from such things as sale of scrap or cash rebates. Dividends, interest, rents, royalties, and other investment-type income are generally excluded, although rents or interest that represent income from business operations are sometimes included (e.g. rents received by real estate operators and interest received by small loan companies). Series V 6 represents the difference between business receipts and the sum of cost of goods sold and other business deductions. It does not reflect investment income; and salaries to owners and contributions or gifts are not allowed as deductions from proprietorship business receipts.

V 8–9, total receipts and net profit (less loss) for partnerships. Series V 8 represents the sum of business receipts (the income from the partnership's principal business activity), investment income such as interest, rents, royalties, nonqualifying dividends, net gain from sale or exchange of noncapital assets, income from farms and other partnerships, and other income. Total receipts do not reflect net losses from the foregoing sources.

Series V 9 represents the difference between total receipts and the sum of cost of sales and operations and other business deductions. The deductions for partnerships exclude both contributions or gifts and additional first-year depreciation.

The term "net profit" is used for both proprietorships and partnerships although it is not strictly comparable for the two forms of business organization. Three differences are (1) investment income is reflected in the partnership, but not in the proprietorship, net profit, (2) salaries paid to the owner(s) are a business deduction for partnerships but not for proprietorships, and (3) additional first-year depreciation is a deduction in the computation of proprietorship, but not partnership, net profit.

V 11–12, total receipts and net profit (less loss) for corporations. Series V 11 includes the gross taxable receipts (i.e., business receipts, taxable investment, income, and certain foreign income) before deduction of cost of sales and operations and net losses from sales of noncapital assets. It also includes nontaxable interest, but excludes all other nontaxable income recognized by the corporation.

The source refers to series V 12 as "net income (or deficit)." It is defined as the difference between gross taxable receipts and the sum of cost of sales and operations and other business deductions allowable for tax purposes. The concept of net income for corporations is not strictly comparable with the concept of net profit for proprietorships and partnerships.

V 13–19. Number of firms in operation, by major industry group, 1929–1963.

Source: U.S. Bureau of Economic Analysis (formerly Office of Business Economics). 1929–1939, *Survey of Current Business*, January 1954, p. 12; 1940–1950, unpublished data; 1951–1958, *Survey of Current Business*, May 1959, p. 18; 1959–1963, *Survey of Current Business*, June 1963, p. 2.

These estimates are based primarily on data from the Bureau of Old-Age and Survivors Insurance and the Internal Revenue Service, and are revised from time to time by the Bureau of Economic Analysis (BEA), formerly the Office of Business Economics. The last substantial revision was made in January 1963 and revealed errors in the earlier estimates for absolute number and rate of growth; these errors were due partly to the cumulative effect of imperfect estimates for discontinued businesses. BEA defines a firm as a business organization under one management; it may include one or more plants or outlets. A self-employed person is considered a firm only if he has either one or more employees or has an established place of business. Concerns owned or controlled by the same interests are not combined. Agriculture and professional services are excluded. A firm conducting more than one kind of business is classified by industry according to the major activity of the firm as a whole. Revisions of the Standard Industrial Classification (see Bureau of the Budget, *Standard Industrial Classification Manual*, 1963) have, therefore, affected the industrial distribution of firms.

V 20–30. Business formation and business failures, 1857–1970.

Source: Series **V 20** and **V 23–30**, Dun & Bradstreet, Inc., 1857–1919, *Dun & Bradstreet Reference Book and Failure Statistics* (a printed mail folder distributed by Dun & Bradstreet); 1920–1970, *The Failure Record Through 1971*, and unpublished data. Series **V 21–22**, U.S. Bureau of Economic Analysis. Series **V 21**, *1971 Business Statistics*, p. 37; series **V 22**, *Business Conditions Digest*, June 1971, series B 12.

V 20, total concerns in business. This series represents the number of business enterprises listed in the *Reference Book*. The figures are for conterminous United States (i.e., excluding Alaska and Hawaii) and represent listings in the books published nearest to July 1 of each year. The listings include types of business which are seekers of commercial credit in the accepted sense of the term; namely, manufacturers, wholesalers, retailers, building contractors, and certain types of commercial service, including public utilities, water carriers, motor carriers, and airlines. Specific types of business not covered are finance, insurance, and real estate companies; railroads; terminals; amusements; and many small one-man services. Neither professions nor farmers are included.

V 21, new business incorporations. This series represents the total number of stock corporations issued charters under the general business corporation laws of the various States and the District of Columbia. The statistics include completely new businesses that have incorporated, existing businesses changed from the noncorporate to the corporate form of organization, existing corporations given certificates of authority to operate also in another State, and existing corporations transferred to a new State. Data for incorporations in the District of Columbia are included beginning January 1963.

V 22, index of net business formation. This series is compiled from monthly national data on number of new business incorporations, number of business failures, and confidential data on telephones installed. These components are adjusted for seasonal variation and number of trading days before being combined into the index.

V 23–26, business failure rate and business failures. The failure rate is obtained by dividing total failures by the total number of industrial and commercial enterprises listed in the Dun & Bradstreet *Reference Book*. Failures are defined as concerns involved in court procedures or voluntary actions, probably ending in loss to creditors. These include, but are not limited to, discontinuances following assignment or attachment of goods, bankruptcy petitions, foreclosure, etc.; voluntary withdrawals with known loss to creditors; enterprises involved in court action such as receivership; businesses making voluntary arrangements with creditors out of court; and since June 1934 (enactment of the Bankruptcy Act), reorganization which may or may not lead to discontinuance.

V 27–30, liabilities. Average liability per failure is obtained by dividing total liabilities by total concerns. Liabilities represent primarily current indebtedness, including accounts and notes payable on secured or unsecured obligations held by banks, officers, affiliates, suppliers, or government at all levels. Beginning in 1933, certain types of enterprises characterized by heavy deferred obligations were eliminated from the data, thus conferring a slight downward bias in average liability figures as compared with earlier years. These series have undergone two revisions. In 1933, they were revised to exclude real estate and finance companies. This revision brought the failure record more nearly in accordance with type of concerns covered by series V 20. In 1939, the series were revised to include voluntary discontinuances with loss to creditors, and small concerns forced out of business with insufficient assets to cover all claims.

V 31–37. Number of new, discontinued, and transferred businesses, by major industry group, 1940–1962.

Source: See source for series V 13–19.

New businesses include only firms which have been newly established. Discontinued businesses include closures of all kinds without reference to the reason for going out of business. A firm which is maintained as a business entity but undergoes a change of ownership is counted as a transferred business, not as a discontinuance. Partnerships in which a member is added or dropped, corporations that are reorganized or reincorporated, and businesses sold or otherwise acquired by new owners or changed in legal form of organization (such as partnership to corporation) are considered transfers. Note should be taken of the large differences between figures for failures in series V 24 and those for discontinued businesses in series V 31.

V 38–40. Recorded mergers in manufacturing and mining, 1895–1970.

Source: 1895–1918, Ralph L. Nelson, *Merger Movements in American Industry*, table 14, p. 37, Princeton University Press, 1959 (copyright, National Bureau of Economic Research, New York); 1919–1930, Carl Eis, *The 1919–1930 Merger Movement in American Industry*, table 1 (reprinted from *The Journal of Law and Economics*, vol. XII (2), October 1969, The University of Chicago (copyright)); U.S. Federal Trade Commission, 1919–1955, *Report on Corporate Mergers and Acquisitions*, 1955; 1956–1970, *Current Trends in Merger Activity, 1970*.

Methods of estimation of the Nelson figures are explained in chapters II and III of his book; the basic source of the figures is chiefly the *Commercial and Financial Chronicle*. The Eis figures

are an extension of the same series, using essentially the same source material.

Federal Trade Commission (FTC) estimates include mergers reported by Moody's Investors Service, Inc., and Standard and Poor's Corporation. For 1919–1939, the estimates were first made by Willard L. Thorp in various publications, and then continued by the FTC. For complete sources and related data, see the FTC reports cited above.

The annual totals of reported mergers are only a small fraction of all "transferred businesses," as shown in series V 31–37. Series V 38–39 are essentially a count of all mergers and acquisitions involving corporations with widely held or publicly traded securities outstanding. There are two offsetting biases of uncertain amount: Mergers may be announced but not actually consummated; small acquisitions by registered manufacturing companies may be consummated without announcement in the sources used.

The FTC series and the Nelson-Eis series use different sources, each of which changes in degree of coverage over time, and are not comparable. The FTC estimates include a more complete recording of smaller mergers, so that average capitalization or assets per merger would on this account tend to decrease, and total assets to increase. However, value data are not available for this series because the FTC does not collect such data for concerns with assets of less than $10 million. Such concerns represented 93 percent of the 1,351 concerns acquired in 1970.

V 41–53. Number of corporations, by industrial division, 1916–1970.

Source: 1916–1933, U.S. Bureau of Internal Revenue, *Statistics of Income*, various annual issues; 1934–1970, U.S. Internal Revenue Service, *Statistics of Income, Corporation Income Tax Returns*, various annual issues.

After 1925, trade is divided into wholesale trade, retail trade, and trade not allocable. The latter, series V 48, varies widely owing to changes in inclusion. The joint figure of wholesale and retail trade for 1916 is not comparable with figures for subsequent years because the "merchandising companies" group was not as inclusive as the "wholesale trade" and "retail trade" groups. This is reflected in the very large figure for all other active corporations. The same is true of "finance, insurance, and real estate" (series V 50) for 1916, then labeled "banks and insurance companies."

V 54–65. Percent of total corporate net income reported by small and large corporations (with net income only), 1918–1939.

Source: U.S. Office of Business Economics, *Survey of Current Business*, March 1944, p. 11.

The data are based on a special tabulation of corporate income tax records by the then Bureau of Internal Revenue. See general note for series V 1–107.

V 66–77. Income of unincorporated enterprises, by industry, 1929–1970.

Source: U.S. Bureau of Economic Analysis (formerly Office of Business Economics). 1929–1963, *The National Income and Product Accounts of the United States, 1929–1965*; 1964–1967, *U.S. National Income and Product Accounts, 1964–67*; 1968–1970, *Survey of Current Business*, July 1972. Table 6.8.

These series measure the earnings of unincorporated business—sole proprietorships, partnerships, and producers' cooperatives—from their current business operations, other than the supplementary income of individuals derived from renting property. Capital gains and losses are excluded, and no deduction is made for depletion.

Estimation in this field has generally required laborious piecing together and adjustment of various types of data from numerous sources. The estimates rely heavily on tax-return tabulations of the incomes of sole proprietorships and partnerships prepared by the Internal Revenue Service.

For a general summary of estimation sources and methods, see Office of Business Economics, *National Income*, 1954 edition, p. 76 ff.

V 78–107. Manufacturing and trade—sales and inventories, 1948–1970.

Source: U.S. Bureau of Economic Analysis (formerly Office of Business Economics), *1971 Business Statistics*, pp. 23–25.

V 78–87, sales. These are estimated aggregate dollar values for the year. "Sales" means essentially billings or shipments for manufacturing and sales or shipments for retail and wholesale trade. In wholesale trade, however, some respondents probably report orders (bookings) as sales.

V 79–81, sales, manufacturing. As used here, "sales" represents manufacturers' receipts, billings, or the value of products shipped, less discounts, returns, and allowances, and exclude freight charges and excise taxes. Shipments for export as well as for domestic use are included. Shipments by foreign subsidiaries are excluded, but those to a foreign subsidiary by a domestic firm are included. The shipments figures from the Bureau of the Census, *Annual Survey of Manufactures*, to which these series are benchmarked, include interplant transfers as well as commercial sales. The figures include adjustments for trading-day and calendar-month variations.

V 82–84, sales, retail trade. The definition of sales of retail stores is in accordance with the 1963 Census of Business. Sales are total receipts from customers after deductions of refunds and allowances for merchandise returned by customers, and include receipts from repairs and from other services to customers, sales for resale, and sales and excise taxes. The data represent total sales and receipts of all establishments engaged primarily in retail trade; they do not include sales at retail by manufacturers, wholesalers, service establishments, or other businesses whose primary activity is not retail trade. The breakdown into durable goods stores and nondurable goods stores is based on the durability of the commodities accounting for the major portion of the sales of each kind-of-business group.

Retail sales estimates are developed as direct measures from a sample representing all sizes of stores, firms, or organizations, and all kinds of retail business throughout the country. Because the estimates obtained are based on a sample, the results are not expected to be in exact agreement with those that would be obtained from a complete census of retail stores in which the same enumeration procedure would be used. For details concerning the sample, see *1971 Business Statistics*, blue pp. 58–59.

V 85–87, sales, merchant wholesalers. See text for series T 375–383.

V 89–91, inventories, manufacturing. Inventory data are book values of stocks on hand at the end of the period, and include materials and supplies, goods in process, and finished goods. Inventories associated with the nonmanufacturing activities of the company are excluded. Manufacturers' inventories are generally valued at the lower of cost or market price while retail and wholesale inventories are valued at cost of merchandise on hand. About one-fifth of manufacturers' inventories are valued on a last-in-first-out basis (see general note for series V 108–305) which is much less prevalent in trade although it is used extensively by department stores. Changes in the book value of inventories reflect movements of replacement costs as well as changes in physical volume.

V 92–94, inventories, retail trade. These data represent estimated book values of nationwide retailers' inventories, valued at the cost of merchandise on hand. Data for Alaska and Hawaii are included beginning 1946.

The breakdown into durable and nondurable inventories is based on the durability of the commodities accounting for the major portion of the retailers' sales. Thus, nondurable items carried by the retailers dealing primarily in durable goods would be reported in durable goods inventories.

V 95–97, inventories, merchant wholesalers. See the text for series T 375–383.

V 98–107, inventory-sales ratios. See the text for stock-sales ratios, series T 375–383.

Series V 1–12. Proprietorships, Partnerships, and Corporations—Number, Receipts, and Profit: 1939 to 1970

[Number in thousands; money figures in billions of dollars. Based on sample of unaudited tax returns filed for accounting periods ending between July 1 of year shown and June 30 of following year]

Year	Total business enterprises			Proprietorships			Partnerships			Corporations		
	Number	Receipts	Net profit (less loss)	Number	Business receipts	Net profit (less loss)	Number	Total receipts	Net profit (less loss)	Number	Total receipts	Net profit (less loss)

* Denotes first year for which figures include Alaska and Hawaii, except 1961 for merchant wholesalers, and 1946 for retail trade inventories.

[1] Average inventories to average monthly sales. Average inventories based on weighted averages of end-of-month figures.

Chapter V

Corporate Assets, Liabilities, and Income (Series V 108-332)

V 108–305. General note.

Aggregate balance sheet and income data for all U.S. corporations combined and for corporations classified by major industry have been published annually since 1926 by the Internal Revenue Service (and its predecessor, Bureau of Internal Revenue) in *Statistics of Income*, part 2. Data classified by asset-size class are also available since 1931. Series V 108–140 and V 167–196 are based on the materials assembled in *Statistics of Income*. Other sources provide balance sheet and income data for public utilities, railroads, and commercial banks over considerably longer periods. Data for public utility corporations are presented, in condensed form, in series V 197–212. Data for railroads are presented in chapter Q, Transportation, and for commercial banks in chapter X, Financial Markets and Institutions.

Most of the series shown here include aggregates based on the values reported by corporations in their accounting statements. These book values are seldom, if ever, equal to current market values, nor do they correspond to theoretical values computed by economic analysts (e.g., values arrived at on the basis of the expected revenue streams). When the general price level remains stable, individual differences between the book value and the market value (or between the book value and the theoretical economic value) may largely cancel out in the process of aggregation. In times of a persistent inflation, however, book values show a general tendency to fall below current market valuations, while in times of persistent deflation the reverse is generally true. Some specific valuation problems, arising in connection with different types of business assets, are briefly discussed below.

Physical assets. Physical assets owned by business firms include inventories (both finished goods and goods in process) and fixed assets (land, plant, and equipment).

Inventories are usually shown on the balance sheet at "cost or market, whichever is lower." Consequently, in periods of rising prices, book values tend to be below current market values. In periods of falling prices, however, conservative accounting practices require an adjustment in the book value so as to bring it down to the level of the current market value.

Book charges for inventories used up in production were formerly based almost universally on the "fifo" (first in, first out) method of valuation, but a substantial number of firms have switched to the "lifo" (last in, first out) method. These two valuation methods yield different results with respect to reported costs and profits and also with respect to the book value of the year-end inventory. Under "lifo" procedure, the most recent prices are used for the computation of costs. Consequently, reported profits (and, therefore, income tax liability) are reduced in periods of rising prices, but are increased in periods of falling prices, as compared with the amount that would be reported under "fifo."

On the other hand, the year-end inventories are valued at less recent prices on a "lifo" than on a "fifo" basis. Consequently, in periods of price instability the use of "lifo" tends to widen the gap between the book value and the current market value of the year-end inventories.

Except in special cases, a comparison of year-end inventory values does not provide an adequate indication of changes in the physical volume of inventories. When "lifo" is used, a change in the book value of inventory will correctly indicate the change in the physical volume valued at current prices, as long as the volume is increasing. If the physical volume is decreasing, however, a valuation adjustment is required in order to arrive at the current value of the physical decrement. When "fifo" is used, a valuation adjustment must be made whether the physical volume is increasing or decreasing.

Since the aggregate inventory values represent a combination of "fifo" and "lifo" inventories (the former being the predominant component), an inventory valuation adjustment is clearly required before any inferences regarding changes in the physical stock are to be drawn from these figures.

Fixed assets include durable capital goods, which are generally entered at cost and are written off gradually over a period of years by means of annual depreciation charges. A detailed balance sheet usually includes (*a*) the gross amount before depreciation, (*b*) the depreciation reserve accumulated to date, and (*c*) the net amount after depreciation, which is equal to (*a*) minus (*b*).

If the prices of capital goods remained constant, the gross amount of plant and equipment would equal their replacement cost (the cost of replacing the existing items, which vary in age from almost new to being close to the time of retirement, with brand new items of the same type). During periods of continual price increases, however, the gross amount falls considerably short of the replacement cost; while during periods of continual price declines, the opposite is true.

The net amount of plant and equipment would approach the current market value only if the annual depreciation allowances corresponded to the actual loss of value through wear and tear as well as obsolescence (and, furthermore, if the prices of new capital goods remained constant). This, however, hardly ever happens in actual practice. Most corporations have been using the "straight line" method of depreciation, under which durable equipment has been written off by equal amounts every year during its entire lifetime, irrespective of the actual degree of wear and tear or obsolescence. During and after World War II accelerated writeoffs were allowed in industries working for defense, whereby plant and equipment could be written off over an arbitrary 5-year period. This procedure, coupled with the fact that prices generally rose at a relatively fast rate during the war and the postwar period, has served to further widen the gap between the net book values and the actual market values of fixed assets.

Neither the gross nor the net amount of plant and equipment may be taken to reflect accurately changes in the physical stock of durable capital goods. If prices remained constant, changes in the gross amount would indicate changes in quantity, though not in quality, of capital goods. For example, if a firm owned 100 units of machinery and added 10 new units next year, the gross amount would show a 10-percent rise (assuming no retirements during the year); but the gross amount could not show the decline in quality of the original 100 units through the process of aging. The net amount does reflect the aging of durable equipment but, as stated above, the prevailing depreciation methods do not—and are not intended to—align the book values with changes in the actual market value over time.

Financial assets. Financial assets of corporations represent their claims on other business units, individuals, and government. Current (short-term) financial assets include cash, bank deposit accounts, notes receivable and marketable securities (mostly U.S. Government but frequently including marketable corporate stock as well). Noncurrent (long-term) financial assets consist of bonds, other long-term debt instruments, and nonmarketable securities which are largely permanent holdings of corporate stock. The problem of market valuation does not, of course, arise in connection with cash and bank deposits. If receivables are salable, their market value does not ordinarily deviate from the book amount by more than a moderate

discount. But in the case of securities, especially common stocks, the current market value may differ widely from the original cost to the owner. Bonds tend to rise in price when the current interest rate declines relative to the coupon rate. Stocks tend to rise when the expected rate of profit and/or dividends earned by the issuer increases. Conservative accounting practice requires that securities be valued at "cost or market, whichever is lower." Thus, while the book values are not expected to exceed the market values for any considerable length of time the reverse relationship may continue indefinitely.

While the market value of stocks tends to rise with—though not necessarily in proportion to—the general level of prices, the market value of bonds is not directly affected by this factor. In fact, in times of inflation or deflation, the fixed amount debt instruments become especially variable in terms of real purchasing power represented by them.

A special problem arises in connection with financial assets when aggregate balance sheets are compiled. In a closed economic system all financial claims and liabilities would cancel out. A consolidated balance sheet for the entire system would show only physical property on the asset side and net claims to this property by individuals on the liability side.

Since the corporate sector of our economy is not a closed system, a consolidated balance sheet for all corporations combined would not eliminate all financial assets and liabilities, although it would eliminate a substantial part representing intercompany claims.

The aggregate balance sheets presented in this section are essentially unconsolidated data. Some large corporations submitted consolidated balance sheets comprising the parent company and its subsidiaries. (Consolidated returns were permitted prior to 1934 and then again after 1942. See text for series V 108–140 and V 167–196.) But, in the main, the total amounts were obtained by mere aggregation rather than consolidation of individual companies' statements.

As a result, the total amounts of both receivables and payables include a certain (undetermined) amount owed by corporations to other corporations. The total amount of investments includes a certain (undetermined) amount of corporate securities owned by corporations. When claims of the creditor corporations on the debtor corporations are included in total assets of the sector as a whole, the total is inflated by the double-counting involved.

Liabilities. The valuation problems encountered in connection with corporate liabilities are generally similar to those discussed above in connection with financial assets. When the price level rises, the amount of debt shrinks in terms of real purchasing power. When the market value of assets increases, the dollar amount of debt remains unchanged, but its magnitude in relation to net worth (valued at market prices) declines. When unconsolidated data are aggregated, the total amount of debt is inflated because no adjustment is made for intercompany liabilities.

The item designated as "other liabilities" (series V 123) includes accrued income tax and other accrued liabilities. Tax accruals were a relatively minor item during the 1920's and 1930's, but assumed major proportions during and after World War II, when the income tax rates were sharply raised and the excess profits tax was imposed (during 1940–1945 and again during 1950–1953). Tax accruals rose substantially also in the years of World War I, but a sharp decline occurred after the war. These movements are reflected in the sample data for large manufacturing corporations, extending over the 1914–1943 period (see text for series V 285–305).

The amount of accrued taxes has not been reported as a separate balance sheet item in *Statistics of Income.* Until recently, the year-end amount of tax accruals usually was fairly close to the current year's total tax liability (series V 137, V 180, and V 195), but the acceleration program enacted in 1954 placed large corporate taxpayers on a pay-as-you-go basis, which tended to reduce their tax reserves.

The rise in the income tax accruals on the liability side of corporate balance sheets was accompanied by an increase in government security holding on the asset side. Thus, in a completely consolidated statement for the corporate sector, the debt owed by corporations to the government would be largely offset by the debt owed by the government to corporations, and the net balance of such claims would be relatively small.

Net worth. Net worth (or equity) is the stockholders' share in the total assets of a corporation. It is not measured by the capital stock account alone, but is equal to the sum of capital stock, capital reserves, paid-in surplus, and earned surplus; or, alternatively, it represents the difference between total assets on the one hand and the sum of all short-term and long-term liabilities on the other. Since the dollar amount of liabilities is fixed at any one time, a revaluation of assets results in a corresponding change in net worth.

In a newly established firm, net worth is equal to the amount of capital paid in by its first stockholders. This amount may be registered in the capital stock account alone, or partly (usually up to the par value per share) in the capital stock account and partly in the paid-in surplus (or capital surplus) account. A going concern, on the other hand, can increase its net worth from two sources—by selling additional shares of stock and by retaining profits. The latter method (known as internal financing) has generally been a very important source of funds for American corporations.

Net profit retained in a given year is reflected in the year-end balance sheet as an increase in the earned surplus account. However, the amount of earned surplus shown on the balance sheet may not generally be taken to represent the sum of all profit retentions over the company's entire lifetime. Many companies declare stock dividends from time to time, and this involves transfers from the earned surplus to the capital stock account. Other companies make occasional transfers from earned surplus to various reserve or special fund accounts. In some cases, earned surplus and paid-in surplus are combined into one account, which makes it impossible to separate paid-in equity from retained funds. Thus, generally speaking, while the balance sheet data for any one year indicate the total amount of net worth, they contain no accurate information as to what portion of net worth has been built up by stock sales and what portion has been accumulated through profit retentions.

Sales, income, and dividends. The sales, income, and dividend figures also represent unconsolidated aggregates, with no adjustment for intercompany transactions. Goods and services sold by corporations to other corporations are included in the total amount of sales two or more times. For example, the value of steel sold by steel producers to automobile manufacturers is included in the sales of the steel industry and also in the sales of the automobile industry (as part of the total value of the automobiles sold). In other words, total reported sales of all industries would exceed by a large margin the net value of corporate production (the sum of all net values added by individual companies) in any given period.

The net income and dividend totals also contain some duplication, since no adjustment has been made for intercompany dividends. When dividends are paid by one company to another, this is obviously a transfer payment which does not increase the actual total income of the corporate sector as a whole. Yet, since such payments are included in net income of the receiving companies without being deducted from net income of the paying companies, the aggregate amount of net income of all corporations is correspondingly inflated.

Problems of asset valuation and income computation have been extensively discussed in the accounting and economic literature. Useful basic discussions may be found in the following books: J. C. Bonbright, *The Valuation of Property,* McGraw-Hill, New York, 1937; N. S. Buchanan, *The Economics of Corporate Enterprise,* Henry Holt & Co., New York, 1940; B. Graham and D. L. Dodd, *Security Analysis,* McGraw-Hill, New York, 4th ed. 1962; J. P. Powelson, *Economic Accounting,* McGraw-Hill, New York, 1955.

The problems encountered in compiling the national income data from the balance sheets submitted by business firms are discussed in Office of Business Economics, *National Income,* 1954 edition, and *U.S. Income and Output,* 1958.

V 108–140 and V 167–196. General note.

Aggregate balance sheet data for all corporations submitting such data with their income tax returns have been published in *Statistics of Income* since 1926. Aggregate income data for all corporations submitting income tax returns have been available since 1916, but income data for corporations submitting balance sheets have been compiled only since 1931.

Companies which did not submit balance sheet data for 1926–1955 represented only a small fraction of the total corporate population in terms of total income and assets. Thus, companies not submitting balance sheets accounted for only 3 percent of the total compiled receipts in 1931 and 1 percent in 1953. The data presented here may, therefore, be taken as a fairly close approximation of the entire corporate population.

For 1926–1950, annual tabulations have been derived from all corporation returns filed. For 1951–1955, the aggregate data for small corporations were estimated on the basis of 10- and 20-percent samples, in order to reduce the cost and delay involved in tabulating all returns. In 1951, sampling procedures were confined to corporations with total assets under $250,000. The sample amounted to 10 percent of this population. In 1952, the companies with total assets under $250,000 were represented by a 10-percent sample. Furthermore, the companies with total assets between $250,000 and $500,000 were represented by a 20-percent sample. All returns with total assets of $500,000 and over together with all consolidated returns, life and mutual insurance companies, personal holding companies, and taxable returns with total income (total gross receipts less cost of sales or operations) of $200,000 and over, regardless of size of total assets, were tabulated.

For 1953–1957, sampling rates were based on gross receipts instead of total assets. For 1953–1955, companies with gross receipts below $100,000 were sampled at a 10-percent rate; 20-percent of the companies with gross receipts between $100,000 and $500,000 were sampled and all companies with gross receipts over $500,000 were included. In 1956–1957, the 20-percent sample was expanded to include companies with gross receipts between $100,000 and $1,000,000. For 1956–1957, all companies with gross receipts over $1,000,000 were tabulated.

In 1958, total assets and net income (deficit) were included with gross receipts as a basis for sample selection. In addition, strata were introduced to cover Small Business Corporation returns (Form 1120S). These were filed for the first time under the Technical Amendments Act of 1958.

Beginning 1959, total assets and net income (deficit) only are the basis for sample selection. In addition, separate sampling plans were developed for "special" returns such as life and mutual insurance companies, etc. As a result, there were eighteen sampling classes and eleven sampling rates in 1968 as compared with seven classes and three rates in 1958.

Although small companies account for a very large share of the total corporate universe in terms of the number of returns, they represent a relatively small share of the total in terms of assets and receipts. Thus, in 1952 the total assets of small companies accounted for only 7 percent of the aggregate figure for all corporations combined.

The data in each volume of *Statistics of Income* are from returns for the calendar year indicated, for fiscal years ending within the period from July of one year through June of the succeeding year, and for partial years with the greater number of months of the accounting period falling within the calendar year. The information is compiled from the returns as filed, prior to revisions that may be made as a result of audit by the Internal Revenue Service. Also, the data do not reflect loss carrybacks, renegotiation of war contracts, or recomputation of amortization of emergency facilities.

The returns included in each report are those filed for comparable periods of time. There are factors, however, which interfere with the precise comparability of the data over a period of years. While their influence has not been so strong as to obscure major historical trends, they must, of course, be borne in mind, especially when close comparisons are attempted. Some of the more important interfering factors are indicated below.

In general, the items for 1926–1933 are not precisely comparable with those for 1934–1941, because of the discontinuance, under the Revenue Act of 1934, of the privilege of filing consolidated income tax returns (except by railroad corporations and their related holding and leasing companies and, for 1940 and 1941, Pan-American trade corporations), and the consequent appearance, in the separate returns filed by corporations formerly included in an affiliated group, of items which, owing to "intercompany eliminations," did not appear on the consolidated return.

The discontinuance of consolidated returns also resulted in changes in industrial classification. A corporation is classified industrially according to the business reported on the return. When diversified activities are reported, the classification is determined by the industry which accounts for the largest percentage of receipts. Therefore, industrial groups may contain data for activities other than those on which the classification is based. Prior to 1934, a consolidated return was classified on the predominant activity of the group of affiliated concerns, whereas, for 1934 and subsequent years, the separate return filed by each concern which was formerly a part of an affiliated group is classified on its predominant industry. Beginning 1942, the consolidated return privilege was again extended, in general, to all corporations.

On the basis of the data contained in the 1934 issue of *Statistics of Income*, two sets of figures are given for 1934 in series V 167–181. In 1934 (comparable with later years), corporations which submitted consolidated returns in 1933 are classified according to the business reported on the deconsolidated returns for 1934. In 1934 (comparable with earlier years, insofar as industrial classification is concerned), corporations which submitted consolidated returns in 1933 are classified according to the business reported on consolidated returns in 1933. The latter data for 1934, however, are still not fully consistent with those for 1933 because they include items which are eliminated in consolidated returns but are present in deconsolidated statements.

There have been other changes in the content of various items, which have affected historical comparability. For example, notes payable with maturity of one year or more were included with bonds and mortgages for 1929–1936, but not for succeeding years. Surplus reserves were included with "surplus and undivided profits" for 1926–1937, whereas they have been shown as a separate item since 1938.

The changes in the Standard Industrial Classification System from time to time do not substantially affect the comparability of these data. The figures have been revised historically to reflect these changes which are indicated in the annual volumes of *Statistics of Income*.

V 108–140. Corporate asset, liability, income, deduction, tax, and profit items, and dividends paid, for all industries, 1926–1970.

Source: U.S. Internal Revenue Service (and predecessor Bureau of Internal Revenue), *Statistics of Income, Corporation Income Tax Returns*, various issues.

Prior to 1959, the statistics represent only the amounts reported by corporations which supplied balance sheet information; thereafter the statistics also include estimated amounts for corporations which owned assets but did not furnish balance sheet information, as well as selected items (other than assets and liabilities) for returns with zero assets.

V 108, number of corporate returns. Except for 1926, excludes returns of inactive corporations.

V 110, cash. Includes bank deposits.

V 111, notes and accounts receivable. For 1958 and prior years, includes loans to stockholders.

V 113, investments in government obligations. Consists of obligations of all governmental units within the United States and its

outlying areas. Where investments are not segregated between "government" and "other," the entire amount is included in "other investments."

V 115, capital assets. Includes depreciable tangible assets such as buildings, fixed mechanical equipment, manufacturing and transportation facilities, furniture and fixtures; depletable tangible assets—natural resources; land; and, for 1939–1970, intangible assets such as patents, franchises, formulas, copyrights, leaseholds, goodwill, and trademarks. Prior to 1939, intangible assets were included in "other assets."

V 116, other assets. Consists of noncurrent assets which were not allocable to a specific account and certain accounts for which no distinction could be made between current and noncurrent status. Includes such items as deferred charges reported as noncurrent by the corporation, interest discounts, guaranty deposits, and intangible assets not subject to amortization. Beginning 1959, includes loans to stockholders and "other current assets" such as nontrade receivables, coupons and dividends receivable, claims and judgments, and short term marketable securities. Prior to 1959, loans to stockholders are included in notes and accounts receivable; and other current assets are included in other assets, other investments, or notes and accounts receivable, except for 1956–1958 data, which represent prepaid expenses and supplies only. Prior to 1956, prepaid expenses are included in other assets. For banks, other assets include property held in trust if included in the banks' assets while, for life insurance companies, they include market value of real estate and that portion of stock and bond holdings in excess of book value.

V 118, notes and accounts payable. Consists of accounts payable and mortgages, notes, and bonds payable with maturity less than one year.

V 119, bonded debt and mortgages. Includes bonds and mortgages payable, regardless of length of time of original maturity, and notes payable with original maturity of one year or more.

V 120, accounts payable. For 1958 and prior years, includes loans from stockholders.

V 123, other liabilities. Consists of obligations which were not allocable to a specific account and were either noncurrent accounts, in general not due within one year, or accounts which could not be identified as either current or long-term. Includes deferred or unearned income not reported as part of a current account, provisions for future taxes based on the effects of either accelerated depreciation or possible income tax adjustments such as for the investment credit, and principal amounts of employee and similar funds. Beginning 1959, includes loans from stockholders; and "other current liabilities" such as accrued expenses, taxes accrued or payable, accrued employee accounts such as payrolls and contributions to benefit plans, dividends payable, overdrafts, accrued interest or rent, and deposits and withdrawable shares of banking and savings institutions. Prior to 1959, loans from stockholders are included in accounts payable; and other current liabilities are included in accounts payable or in other liabilities, except 1957 and 1958 data, which represent accrued expenses only.

V 126, retained earnings, appropriated. Included with surplus and retained earnings, unappropriated, for 1926–1937.

V 127, surplus and retained earnings, unappropriated. Consists of paid-in or capital surplus, and, for 1926–1937, retained earnings, appropriated.

V 130, gross sales and receipts from operations. Gross sales consist of amounts received for goods, less returns and allowances, in transactions where inventories are an income-determining factor. Cost of goods sold is shown as a deduction. Gross receipts from operations consist of amounts received from transactions in which inventories are not an income-determining factor. Cost of operations is shown as a deduction. Gross receipts from operations and cost of operations are not available prior to 1932. The figure shown for 1931 represents gross profit from operations.

V 139, dividends paid in cash and assets other than own stock. Excludes liquidating dividends.

V 141–166. Nonfinancial corporations, gross product and unit costs, 1948–1970.

Source: U.S. Bureau of Economic Analysis, *Survey of Current Business*, March 1972, p. 22.

The data presented here consist of annual estimates of the output of nonfinancial corporations, capital stocks and inputs, labor inputs consistent with the Bureau of Economic Analysis (BEA) compensation and employment series, combined labor and capital inputs (total factor input), and profits. The output, profit, and stock estimates are based on the assumption of consistent depreciation practices. Total factor productivity is estimated, as well as the partial productivity of labor and capital separately. Also, rates of return to capital stock are calculated, relating property income to the capital stock valued at current replacement cost.

In interpreting these results it should be kept in mind that the capital input measure is based upon the constant dollar stock of capital owned by nonfinancial corporations, and is thus not adjusted for changes in the degree of utilization of the capital stock. Also, labor input is measured by total man-hours worked instead of the more sophisticated techniques underlying other studies of factor input and productivity, for instance, Edward F. Denison's 1962 study, *The Sources of Economic Growth in the United States and the Alternatives Before Us.*

The output measure most appropriate for comparison with total factor inputs is output valued at factor cost in constant (1958) dollars, because it excludes capital consumption allowances and indirect business taxes which are not returns to factors of production. This measure is derived by deducting from BEA's measure of constant dollar gross product originating in nonfinancial corporations the sum of constant dollar capital consumption allowances, indirect business taxes (net of subsidies received) and business transfer payments.

The gross product of nonfinancial corporations in current dollars, series V 141, is estimated from the income side of the national income and product accounts. The estimates of compensation of employees, series V 147, are largely based upon data collected from establishments reporting under the unemployment insurance system, with legal form allocations based on data from the economic censuses. The estimates of capital consumption allowances, series V 143, business transfer payments, included in series V 145, net interest, series V 150, and profits, series V 152–156, are based upon statistical tabulations of income tax returns. Indirect business taxes and subsidies are obtained from government accounting records, with allocations of indirect business taxes by legal form of organization made on the basis of the value of output produced.

The constant dollar measure of gross corporate product, series V 158, is derived from BEA's estimates of gross product by industry by multiplying each industry's real gross product by the percentage of that industry's output attributable to corporations and summing to a total for nonfinancial corporations. Capital consumption allowances and indirect business taxes (net of subsidies) and business transfer payments are estimated in constant (1958) dollars and deducted from gross corporate product in order to provide output valued at factor cost in constant (1958) dollars.

The capital consumption allowances shown in BEA's regular presentation of data on nonfinancial corporations are valued at historical cost and are affected by changes in depreciation practices permitted under Federal tax laws and regulations. To obtain constant dollar output at factor cost, this measure is replaced with an estimate of capital consumption allowances in constant (1958) dollars that is based on the assumption of straight-line depreciation with service lives averaging 85 percent of those shown in Bulletin F of the Internal Revenue Service.

In order to obtain profits based on consistent depreciation practices and current cost valuation, this new measure of capital consumption was also valued at current prices and then deducted from the sum of

profits and capital consumption allowances as shown in the regular presentation. In series V 141–166, the difference between the regularly shown capital consumption allowances at historical cost and the newly computed measure in current prices is shown as the "depreciation adjustment," series V 144. The method for deriving capital consumption allowances in current and constant dollars is discussed in the section on capital stock in the source publication. For the source study, a constant dollar measure of indirect business taxes was derived, and this measure was used to extrapolate the $\$\frac{1}{2}$ billion 1958 value of business transfer payments less subsidies. Constant dollar indirect business taxes were obtained by extrapolating the value of indirect taxes in 1958 by the output of the taxes commodities and services. Taxes on heavily taxed products or products whose output fluctuated more than average were estimated separately. The value of the automobile excise tax in 1958 was extrapolated by constant dollar auto product; liquor taxes by constant dollar personal consumption expenditures for alcoholic beverages; tobacco taxes by constant dollar personal consumption expenditures for tobacco products; gasoline taxes by the number of gallons consumed; and property taxes on residential structures by the constant dollar net stock of these structures owned by nonfinancial corporations. All other taxes, accounting for 65 percent of the 1958 total, were extrapolated by an estimate of constant dollar net corporate product at market prices excluding corporate product associated with the separately extrapolated items.

V 167–181. Selected corporate asset, liability, income, and tax items, and dividends paid, by industrial division, 1926–1970.

Source: See source for series V 108–140.

Includes Alaska and Hawaii for all years.

V 172, investments. Consists of investments in government obligations, other investments, and mortgage and real estate loans.

V 174, accounts payable and short-term debt. Consists of accounts payable and mortgages, notes, and bonds payable in less than one year.

V 175, long-term debt. Consists of mortgages, notes, and bonds payable in one year or more.

V 177, surplus and retained earnings. Consists of paid-in or capital surplus and retained earnings, appropriated and unappropriated.

V 182–196. Selected corporate asset, liability, income, and tax items, and dividends paid, by size of total assets, 1931–1970.

Source: See source for series V 108–140.

Includes Alaska and Hawaii for all years.

V 187, investments. Consists of investments in government obligations, other investments, and mortgage and real estate loans.

V 189, accounts payable and short-term debt. Consists of accounts payable and mortgages, notes, and bonds payable in less than one year.

V 190, long-term debt. Consists of mortgages, notes, and bonds payable in one year or more.

V 192, surplus and retained earnings. Consists of paid-in or capital surplus and retained earnings, appropriated and unappropriated.

V 197–212. Assets, liabilities, and selected income items for privately owned Class A and B electric companies, 1937–1970.

Source: U.S. Federal Power Commission, all series except V 200–202 for 1937–1956, *Statistics of Electrical Utilities in the United States*, various annual issues; **series V 200–202,** 1937–1956, unpublished data.

These data cover reports of all Class A and B companies: Class A companies having annual electric operating revenue of $2,500,000 or more; Class B companies having annual electric operating revenue of more than $1,000,000 but less than $2,500,000. In recent years, these concerns have represented approximately 98 percent of the total privately owned electric utility industry.

V 197, total assets or liabilities. For total assets, series V 197 is the sum of series V 198, V 199, V 202, and V 203. For total liabilities, series V 197 is the sum of series V 204–209.

V 198, current assets. Includes cash, special deposits, working funds, temporary cash investments, receivables (less reserve for uncollectible accounts), materials and supplies, prepayments, other current and accrued assets.

V 199, investments. Includes investments in associated companies (less reserve), other investments (less reserve), physical property other than utility plant (less reserve), sinking funds, miscellaneous special funds.

V 200–202, plant and equipment in service. Prior to 1932, firms in the electric utility industry included in their electric utility plant and equipment accounts an increasing amount of "phantom assets" which were created by "writing up" assets above their original cost. Changes in economic conditions and government regulation forced a "write-down" of these "assets" at intervals over subsequent years. Until such "write-downs" were made, however, the figures as published in the annual reports of the Federal Power Commission included decreasing amounts of "phantom assets." However, the figures shown here for series V 197–202 represent revised estimates of the Federal Power Commission and exclude "phantom assets."

V 203, other assets. Includes the "phantom assets" deducted from electric plant and equipment (see text for series V 200–202); electric plant not in service such as plant under construction, leased to others, or held for future use; net utility plant and equipment other than electric; deferred debits; capital stock discount and expenses; and reacquired securities. Although there was some decline in deferred debits, capital stock discount and expense, and reacquired securities, the major portion of the decline in this series between 1937 and 1945 is attributable to the writeoff of "phantom assets." The distribution of these assets for significant years was as follows (in millions):

Item	*1937*	*1948*	*1956*
Total other assets	**$4,833.9**	**$3,657.3**	**$5,207.1**
"Phantom assets"	2,100.0	-------	-------
Electric plant not in service	450.0	1,472.1	1,945.0
Net utility plant other than electric	1,683.6	1,876.6	2,959.4
Other asset items	600.3	308.6	302.7

If the "phantom assets" were to be completely excluded from the asset side, a corresponding adjustment would have to be made in the companies' net worth. This has not been done, because it has been deemed advisable to present the capital and surplus figures as reported by the electric companies.

V 204, current liabilities. Includes notes and accounts payable, dividends declared, customers' deposits, accrued taxes and interest, miscellaneous current and accrued liabilities.

V 205, long-term debt. Includes bonds, receivers' certificates, advances from associated companies, miscellaneous long-term debt. Bonds held in treasury were deducted from the total amount of long-term debt outstanding.

V 206, other liabilities. Includes deferred credits, insurance, and other reserves.

V 207, capital stock. Includes common and preferred stock.

V 208, other paid-in capital. Includes premium on capital stock, capital stock discount and expenses, other capital stock items, and reacquired capital stock.

V 209, net surplus. Includes capital and earned surplus.

V 210, total revenue. Includes operating revenues and other income, gross of operating expenses, and all other deductions.

V 211, net income. Equals total revenue less all operating and nonoperating income deductions (including depreciation, interest, and taxes).

V 212, dividends. Includes dividends on preferred and common shares. Excludes stock dividends.

V 213–227. Assets, liabilities, and selected income items for central electric light and power stations, commercial, 1902–1937.

Source: U. S. Bureau of the Census. 1902–1912, *Electrical Industries*, special reports and bulletins for 1902, 1907, and 1912; 1917–1937, *Census of Electrical Industries*, reports for 1917, 1922, 1927, 1932, and 1937.

See also text for series V 197–212.

Central electric stations are defined as plants owned or operated by individuals, companies, corporations, or municipalities, and furnishing current for public or commercial uses.

Although central electric stations, as defined by the Bureau of the Census, do not represent a group completely identical with Class A and B electric companies, as defined by the Federal Power Commission, the coverage is nearly the same in terms of assets, liabilities, and revenues, as the figures for 1937 show. Consequently, the data in series V 197–212 and V 213–227 may be taken to indicate, with a high degree of approximation, financial trends in the electric utility industry over the entire 1902–1937 period.

Unfortunately, complete balance sheet data for series V 213–227 are available only for 1927, 1932, and 1937. The data for 1912, 1917, and 1922 do not include reserve for depreciation. Consequently, total assets for these years include the gross rather than net value of plant and equipment. The only balance sheet item available for 1902 and 1907 is the gross amount of plant and equipment. The gross revenue, net income, and dividend figures, however, are available for the entire 1902–1937 period.

The accounting nomenclature in series V 213–227 and also in series V 228–272 is similar to that described above for series V 197–212. However, financial statements were much less detailed in the early years and accounting procedures did not remain fully consistent over the entire 1902–1937 period.

V 228–242. Assets, liabilities, and selected income items for street and electric railways, 1902–1937.

Source: See source for series V 213–227.

See also text for series V 197–212.

These data relate to all electric railways in the United States irrespective of their length or location and all street railways irrespective of their motive power.

Data for 1902–1922 include companies which operated street and electric railways and were also engaged in other activities, while the data for 1922–1937 include only companies which were exclusively engaged in the operation of street and electric railways. The double set of figures given for 1922 should enable users to make an adjustment required for comparing the figures for 1927–1937 with those for 1902–1917. For 1917–1937, the total assets include net value of plant and equipment. For 1902–1912, they include gross value of plant and equipment because of the lack of data on depreciation.

V 243–270. Assets, liabilities, and selected income items for telephone and telegraph companies, 1902–1937.

Source: See source for series V 213–227.

See also text for series V 197–212.

The data available for the telephone and telegraph companies for 1902–1937 are even more incomplete than those for the electric utilities. After 1922, the only data collected by the Bureau of the Census were value of plant and equipment, gross income, and dividends paid. During the entire 1902–1937 period, reserves for depreciation were included with other reserves on the liability side and could not, therefore, be used to obtain net value of plant and equipment. Treasury stocks and bonds were reported as a single item (Treasury securities) and could not, therefore, be subtracted from long-term debt and capital stock respectively, as was done for the other electrical industries.

Despite these serious deficiencies, the data throw some light on the rapid development of the telephone and telegraph industries in the early decades of the 20th century and should, therefore, be useful to those interested in financial trends of these two industries.

V 271–284. Net value of plant and equipment in regulated industries, 1870–1951.

Source: Melville J. Ulmer, *Capital in Transportation, Communications, and Public Utilities*, National Bureau of Economic Research, Princeton University Press, 1959 (copyright).

All values in these series are net of depreciation and relate to reproducible fixed assets: Road, plant, and equipment. Investment in land and land rights has not been included. The coverage is confined to privately owned enterprises.

In general, the series have been obtained by cumulative addition (or subtraction) of the annual figures on net capital formation to a base value in some selected year. The series in 1929 dollars reflect changes in net physical stock of reproducible fixed assets. The series in current dollars indicate changes in the replacement value of such assets, less depreciation.

More specifically, the derivation of the series in 1929 dollars involved the following steps:

a. Finding a base-year figure. For steam railroads, the base-year value was derived from an ICC estimate for January 1, 1937. For electric light and power companies, the value of plant and equipment was assumed to be zero as of January 1, 1881. For telephones, the value for 1880 was derived from estimates of gross capital expenditures in 1878 and 1879. For street and electric railways, the value for 1870 was obtained from the reports submitted to State railroad commissions. For local buslines, it was assumed that net value for 1910 was less than $100,000.

b. Converting the base-year figure into 1929 dollars.

c. Deriving the series on net capital expenditures in 1929 prices. This series was obtained by deducting the estimated annual amounts of "true" depreciation from the figures on gross capital expenditures for the corresponding years.

d. Applying the series on net capital expenditures to the base-year value.

The series in current dollars for each class of utilities was obtained by multiplying the values in 1929 dollars by the construction cost index applicable to that class.

V 285–305. Assets, liabilities, and selected income items for two samples of large manufacturing corporations, 1914–1943.

Source: National Bureau of Economic Research, unpublished data.

These series represent financial data for two samples of large corporations (companies with total assets over $10 million each). The data for 1914–1922 are based on a sample of 81 corporations, and the data for 1922–1943 are based on a sample of 84 corporations. These sample materials make it possible to examine financial developments in manufacturing during World War I and the early part of the interwar period, for which time no aggregate data are available.

For both samples, companies were selected from among the largest and most important concerns in 11 major manufacturing industries. A few of the very large corporations (e.g., Ford Motor Company) had to be omitted because of lack of published financial statements, but the number of such omissions was small. Consequently, both samples, though small in terms of the number of firms included, represent substantial portions of the entire manufacturing universe in terms of total assets and total volume of operations. For example, in 1933 the sample represented 29 percent of the total assets of all manufacturing corporations and as much as 45 percent of the total assets of all large manufacturing corporations (with total assets over $10 million). (See A. R. Koch, *The Financing of Large Corporations*, National Bureau of Economic Research, New York, 1943, p. 13.)

In the sample for 1914–1922, data were not available for 8 companies in 1914, 3 companies in 1915, 1 company in 1916, and 1 company in 1917. In the sample for 1922–1943, 3 companies had to be

omitted in 1922, 1 in 1923, 1 in 1924, and 1 in 1925. Since the excluded firms were among the smallest in the samples, however, their omission had a relatively minor effect on the composite balance sheets and income statements.

The amounts of total assets, income, and dividends for the sample for 1922–1943 are considerably greater than those for the sample for earlier years. This is due to the fact that in a number of cases larger companies were substituted in the sample for 1922–1943 for smaller concerns included in the sample for 1914–1922. These differences should be borne in mind when trends over the entire period are examined.

For a more detailed description of these samples, see the unpublished manuscript, *Corporate Financial Data for Studies in Business Finance*, May 1945, available at the National Bureau of Economic Research.

The accounting terms used in these series are defined as follows:

Total assets: Sum of all asset items less depreciation and revaluation reserves.

Cash: Cash on hand and bank deposits.

Marketable securities: Government securities; call and time loans.

Receivables: Notes and accounts receivable less bad debt reserve.

Inventory: Raw materials; goods and work in process; finished goods; supplies—less reserves for inventory.

Investments and advances: Investment in, or advances to, subsidiaries or affiliated; other stocks and bonds.

Fixed assets (net): Land; plant; machinery; equipment; nonoperating property—less reserves for depreciation, depletion, and obsolescence.

Other assets: Prepaid expenses; deferred charges; intangibles; due from officers, directors, and stockholders; cash set aside for specific purposes or not available for immediate use.

Notes payable: All notes or bills to banks, trade, and others.

Accounts payable: Accounts payable to trade.

Other current liabilities: Accruals and current reserves.

Long-term debt: All funded debt or mortgages, whether current or not, less sinking fund when listed on asset side; purchase obligations.

Other liabilities: Minority interest; deferred liabilities; amounts appropriated from surplus for specific purposes; due to officers, employees, and affiliates.

Preferred stock: Preferred and debenture stock less treasury preferred stock when listed on asset side.

Common stock: Common stock (A and B) or capital stock less common treasury stock when listed on asset side.

Capital reserves: Special appropriations from income or surplus for contingencies.

Surplus: Capital and earned surplus less profit and undivided surplus when carried on asset side.

Net income: Net amount after all expenses, interest, and taxes.

Dividends: Cash dividends on preferred and common shares. Stock dividends are not included.

V 306–332. Business expenditures for new plant and equipment 1947–1970.

Source: U.S. Office of Business Economics (OBE), 1947–1969, *Survey of Current Business*, January 1970, p. 25–39; 1970, *Survey of Current Business*, March 1971, p. 20. Series prepared jointly with U.S. Securities and Exchange Commission (SEC).

These series measure estimated expenditures for new structures and additions to existing plants (including major alterations), as well as expenditures for new machinery and equipment that are chargeable to fixed asset accounts. They include expenditures for replacement purposes and for additions and modernization and exclude expenditures for land, costs of maintenance and repairs, items charged off as current operating expense, new facilities owned by the Federal Government and operated under contract by private companies, and plant and equipment furnished a company by communities and organizations.

Coverage is extended to all private nonagricultural business except real estate operators; medical, legal, educational, and cultural services; and nonprofit membership organizations. The data generally reflect company expenditures, aggregated on a fully consolidated basis, rather than individual establishment data. Each company is assigned an industry classification on the basis of its primary activity, utilizing the Standard Industrial Classification system. Thus, the total capital expenditures of a company for both its primary and secondary activity are included under the assigned industry category. The possible effect of the aggregation of company data in this manner is that the expenditures of one industry could be included in a different industry's total.

Data on plant and equipment expenditures appearing prior to 1947 in a similar OBE-SEC series are not entirely comparable to the series for 1947 to 1970, due to revisions that have occurred. The effect of the revisions, which are benchmarked to data from the 1958 and 1963 censuses, was to increase the rate of growth of capital expenditures over the period for both manufacturing and nonmanufacturing industries.

The gross national product (GNP) series on fixed nonresidential investment (F 54–56) differs from these series in definition and industry coverage. The GNP investment accounts cover capital expenditures of farm enterprises, professional persons, real estate operators, and nonprofit institutions and include oil well drilling costs charged to current expense, automobile costs used for business purposes, net purchases of used capital goods from government, and dealers' margins on used capital purchases, all of which are not covered or included by these series. The national accounts investment data are derived in a largely indirect manner from a variety of sources, with the equipment component resulting from the utilization, basically, of the commodity flow technique that provides commodity detail. The structures component is obtained in an equally indirect manner from Census Bureau construction data and other sources. In contrast, the OBE-SEC series is based primarily on sample survey results and provides expenditure estimates by purchasing industry.

★ ★ ★ ★ ★ ★ ★ ★ ★ ★ **More Recent Data for *Historical Statistics* Series** ★ ★ ★ ★ ★ ★ ★ ★ ★ ★

Statistics for more recent years in continuation of many of the still-active series shown here appear in annual issues of the *Statistical Abstract of the United States*, beginning with the 1975 edition. For direct linkage of the historical series to the tables in the *Abstract*, see Appendix I in the *Abstract*.

Series V 108–140. Corporate Asset, Liability, Income, Deduction, Tax, and Profit Items, and Dividends Paid, for All Industries: 1926 to 1970

140	Corporation's own stock	212	90	142	162					

NA Not available.
[1] Prior to 1954, based on original maturity date; beginning 1954, based on date of balance sheet.
[2] Net amount beginning in 1954. For 1937–1953, this is the sum of all positive amounts reported; for 1926–1936, the sum of positive net surplus and undivided profits.
[3] Includes deficit of $7,655 million.
[4] For 1937–1953, this is the sum of all deficits reported (1953 deficit, $7,655 million); for 1926–1936, sum of net deficits.
[5] "Other investments" were included in "Other assets" for all corporations, 1926–1928, and for life insurance companies, 1929.
[6] For 1931, gross profit was reported in lieu of gross receipts and cost of operations.
[7] Not available separately for returns with balance sheets.
[8] Loss.

* Denotes first year for which figures include Alaska and Hawaii.
NA Not available.
[1] Includes net value of plant and equipment when a reserve for depreciation is shown; otherwise, gross value.
[2] Reflects assignment of par value to stock previously without par value and transfer to premium on capital stock of difference between par value and stated value.
[3] Comparable with later years. [4] Comparable with earlier years.
[5] Intercompany holdings of independent companies not deducted.

Series V 271–284. Net Value of Plant and Equipment in Regulated Industries: 1870 to 1951

[In millions of dollars. As of January 1]

[3] Includes apparel, tobacco, leather, printing, and publishing.
[4] Includes trade, service, construction, finance, and insurance.

Chapter W

Productivity and Technological Development

Productivity Indexes (Series W 1-81)

W 1–81. General note.

Work in the field of productivity has been carried on by many individuals and organizations, especially the U.S. Bureau of Labor Statistics (BLS) and the National Bureau of Economic Research (NBER). Extensive work is being done by BLS, which measures productivity for the economy and for selected major sectors and industries.

Productivity can be defined generally as the ratio relating output (goods and services) to one or more of the inputs (labor, land, capital, energy, etc.) associated with that output. A variety of productivity measures can be developed, the particular form depending on the purpose to be served. Output per labor input is useful in understanding changes in employment or labor cost. A more comprehensive measure would be output per unit of labor and capital combined which is useful in studying how the economy has used these resources. The latter measures, which have been developed by John W. Kendrick for NBER, are covered in series W 5–8. Their construction is described in the NBER volume, *Productivity Trends in the United States*, 1961, General Series 71, and in *Postwar Productivity Trends in the United States*, 1973, General Series 98.

Historically, the measure of productivity which is most commonly used has been output per unit of labor input—frequently called "labor productivity." Such a measure reflects not only labor's effort but also other factors, including state of technology, capital per worker, availability of materials, the efficiency of management, rate of operations, and changes in the composition of the work force. Measures of this type have been developed by the BLS.

The output part of a labor productivity ratio may also be defined in several ways. The simplest one, conceptually, is what is called physical output, where the components are physical units such as pounds, bushels, number, etc. To arrive at total measures for an industry or an industry group, the units are weighted by man-hours or the closest equivalent (such as labor cost or value added). This type of measure is a weighted arithmetic average of the productivity change of its components. The BLS industry estimates are of this type. For a more detailed description of the concepts and procedures used, see chapter 26, *BLS Handbook of Methods for Surveys and Studies*, Bulletin 1711, 1971.

Estimates for broad aggregates, such as manufacturing or the total private economy, are constructed in terms of another output concept called value added or net output where purchased "intermediate" products consumed in the production process are excluded. This type of measure in relation to man-hours reflects not only the average of the individual industry productivity changes, but also shifts in the relative importance of low- or high-productivity industries.

Man-hours in labor productivity data can refer to either hours worked or hours paid for. The latter include not only hours worked but also paid leave time such as vacations, sick leave, and holidays.

The specific year chosen for the weight base may affect the trend of the productivity series. For example, output valued in 1954 prices would undoubtedly show a different trend from net output valued in 1958 prices. In general, a current year-weighted productivity index gives a lower trend than a base year-weighted index, since items which increase most in volume of output tend to be those with price declines or lower price increases.

Productivity series suffer from statistical limitations which are common to most production estimates. Quality change cannot be adequately accounted for in measuring changes in output; price indexes often do not cover a sufficiently broad industrial area; and man-hour weights for constructing physical output series are frequently not available. Productivity statistics also have additional limitations arising out of the noncomparability of output and man-hour series.

W 1–11. Indexes of national productivity, 1889–1970.

Source: **Series W 1–8**, John W. Kendrick, 1889–1966, *Productivity Trends in the United States*, National Bureau of Economic Research, Princeton University Press, 1961, (copyright) and *Postwar Productivity Trends in the United States*, National Bureau of Economic Research, 1973 (copyright); 1967–1970, computations supplied by John W. Kendrick. **Series W 9–11**, U.S. Bureau of Labor Statistics, *Productivity, Wages, Prices, and Employment*, press release issued quarterly, tables 1 and 2.

These indexes are measures of aggregate productivity for the total private economy and the major segments thereof. The NBER series (W 1–8) show the change in real gross product per unit of factor input after adjustments to exclude general government and real net factor income from abroad. The BLS series (W 9–11) exclude only general government and retain real net factor income from abroad. Since the latter amount as a percent of total product is extremely small, the difference between the two series in this regard is relatively small. For both series, the numerator is derived from the Department of Commerce gross national product series (with some adjustments), carried back from 1929 in the case of the NBER series, chiefly by the national product estimates of Simon Kuznets, supplemented by estimates of government purchases by John W. Kendrick.

Although the numerator of the indexes is adjusted gross national product, the indexes are actually measures of the net productivity of the economy. This arises as the result of "netting" out all intermediate purchases of goods and services, thus eliminating duplication and measuring only the "end product" of the system. Indexes of net productivity may therefore move differently from gross productivity indexes according to changes in the efficiency of materials utilization which are not reflected in gross output indexes of productivity.

The indexes are "real" in the sense that price fluctuations have been eliminated by various means. In the NBER series, the net goods and services produced were combined in six segments or "comparison periods" by a Marshall-Edgeworth formula using as weights the average prices in the terminal years of each period. The final production index is thus a chain index with shifting weights between links, but fixed weights within links. Over the long period, therefore, the productivity index reflects the overall shifts in the industry composition of the aggregates. The comparison bases are 1929 for 1889 to 1933 and 1958 for 1929 to 1970.

The output measure in the BLS index is derived from constant dollar aggregates of gross national product published by the Department of Commerce. These aggregates represent the deflation of current dollar values by weighted price indexes. The resultant indexes of net output approximate production indexes with 1958 representing the price base and 1967 the comparison base.

W 1–3, real gross private domestic product per man-hour. This series shows changes in over-all productive efficiency in terms of man-hours as the physical unit of labor input. In general, the estimates of man-hours were obtained by multiplying employment by average hours worked per year in the various industrial groupings. The industry hours were combined to the desired level of aggregation without explicit weights. The exception to the general rule for derivation of total hours occurred in the farm sector where the Agricultural Marketing Service estimates of farm labor requirements in terms of "average adult man-hour equivalents" were used. The AMS estimates were adjusted upwards by 10 percent in all years to attain a level comparable to that of the other sectors.

For the private nonfarm sector, employment data are based upon establishment reports or represent extrapolations of establishment-type estimates. The estimates since 1929 are by the U.S. Bureau of Economic Analysis (formerly Office of Business Economics). Prior to 1929, they are extrapolations of various benchmark estimates and are largely those used in previous NBER studies of output and employment.

W 4, product per unit of labor input. This series measures net output per weighted man-hour. Man-hours for industry groups or segments were combined by average hourly earnings, using the Marshall-Edgeworth cross-weighting formula. The comparison periods conforming to those in the output index were used. Aside from making possible a comparative study of the movements of output per weighted and per unweighted man-hour, the construction of this index makes possible the combination of the capital and labor inputs and the derivation of indexes of net output per unit of total factor input.

W 5, product per unit of capital input. This series expresses the change in total productivity in terms of real capital assets. The capital input of the private domestic economy was defined to include land and replaceable assets, such as residential and nonresidential structures, equipment, and inventories. The estimates are based primarily on those by Raymond Goldsmith in *A Study of Saving in the United States*, vol. 3, Princeton University Press, 1956. Index numbers of real capital stocks for separate industry groups were combined by use of the Marshall-Edgeworth formula, using unit capital compensation as weights. The system parallels that used in the index of labor input.

W 6–8, product per unit of total factor input. These series are conceptually more inclusive measures than those shown in series W 1–5 since they relate the quantity of net output to the real quantity of total factor input required to produce it. The index of total factor input is the weighted average of the index of labor input and the index of capital input previously described. The weights are units of factor compensation and the combination was made by applying the Marshall-Edgeworth formula.

W 9–11, real gross private product per man-hour. The output measures used in these productivity estimates—gross product originating developed by the U.S. Bureau of Economic Analysis—are based on a value added concept and represent an unduplicated count of the goods and services produced in an industrial sector. In current dollars, the output data reflect both changes in prices and the physical volume of production. For productivity measurement, only changes in the volume of production are relevant so that output is adjusted for price change and expressed in constant dollars of a base year, which is 1958 for these indexes.

Man-hours refer to hours paid rather than hours worked. They are derived primarily from the BLS establishment data on employment and average weekly hours, supplemented by employment and hours from national income data and the BLS labor force series. The latter is the source of man-hours in the farm sector. Man-hours for the private and nonfarm sectors are the simple aggregate of man-hours computed for each industrial sector. Employment and man-hours data are published in *Employment and Earnings*. A complete description of the methods and procedures used to develop these output per man-hour measures appears in chapter 25 of the *BLS Handbook of Methods*, Bulletin 1711.

W 12. Productivity—index of output per man-hour for production workers, total mining (1929 = 100), 1890–1960.

Source: John W. Kendrick, *Productivity Trends in the United States*, National Bureau of Economic Research, Princeton University Press, 1961 (copyright).

An earlier index appearing in Harold Barger and Sam H. Schurr, *The Mining Industries, 1899–1939: A Study of Output, Employment, and Productivity*, NBER, New York, 1944, provided the basis for this series. The earlier index has been extended back by Kendrick to cover years omitted by Barger and Schurr and to include the later period, 1939–1960. Since Kendrick's study of the mining industry was part of a study of national productivity, the need for consistency between the several sectors caused some modification of the Barger and Schurr index.

The mining industry covers all extraction of minerals including stone quarrying and the pumping of crude petroleum. The output index is a price-weighted aggregate of the Marshall-Edgeworth type and is of "modified chain" construction. Separate indexes were computed for each of several comparison periods using the mean of the commodity prices for the terminal years of each period. The indexes of the comparison periods were then linked to obtain an index covering the entire period.

The general weighting scheme of the original study was followed in the Kendrick revisions, except that he applied national income per unit of output as the weighting factor for combining the broad industry groups into the sector aggregate. These broad groups are metal mining, nonmetallic mining and quarrying, oil and gas wells, bituminous coal, and anthracite. For years prior to 1919, the 1919–1929 weights were used.

Basic sources of quantity and value data for the original production index were *Mineral Resources of the United States*, published annually for 1882–1931; and *Minerals Yearbook*, published annually since 1932–33. These volumes were prepared and issued by the U.S. Geological Survey from 1882 to 1923 and by the U.S. Bureau of Mines since 1924.

Labor input data for 1902 are from the U.S. Bureau of the Census, whereas later data are from accident statistics collected by the Bureau of Mines. The data are man-days used in actual mine operation; in most cases, the average number of employees times the number of days the mine operated during the year. BLS reports on employment and average hours have been used since 1939. The estimates of man-hours are the products of man-days times the "nominal" hours worked per day. Nominal hours are implicitly defined as the number of hours customarily worked on one shift in a regular workday by all persons "engaged in production."

W 13. Productivity—index of output per man-hour for production workers, total mining (1947 = 100), 1880–1950.

Source: U.S. Bureau of Labor Statistics computations, 1880–1935, based on WPA National Research Project, *Production, Employment, and Productivity in the Mineral Extractive Industries, 1880–1938*; 1935–1950, based on BLS, *Productivity Trends in Selected Industries, Indexes Through 1950*, Bulletin No. 1046.

For 1935–1945, the index for mining represents 6 individual mining industries, for 5 of which the BLS published separate series—bituminous coal, anthracite, iron, copper, and lead and zinc. The production index from which the combined index is derived is an average of the 5 separately published series plus a series for crude petroleum and natural gas weighted with current man-hours; the man-hours index is based on totals for the 6 industries. The productivity index for the years before 1935 is based on the WPA National Research Project study.

The individual mining series (W 14–21) are published annually in a BLS release, *Indexes of Output Per Man-Hour: Selected Industries*. The production data for these series are from the U.S. Bureau of Mines. Employment and average weekly hours series are those of BLS for 1939–1970. For 1935–1939, BLS series were used for the

coal industry and Bureau of Mines data for metal mining. The employment definition adopted (average number of wage earners employed during the 12 months of each year, including months of no activity) is the concept used by the Bureau of the Census.

W 14–21. Productivity—indexes of output per man-hour for production workers, selected mining industries, 1935–1970.

Source: U.S. Bureau of Labor Statistics, 1939 and 1947–1970, *Indexes of Output Per Man-Hour: Selected Industries, 1973 Edition*, Bulletin No. 1780; all other years, BLS computations.

Production data on which the indexes are based come from the U.S. Bureau of Mines, *Minerals Yearbook*, and the U.S. Bureau of the Census, censuses of mineral industries. The man-hours components of the indexes are derived from the regularly published BLS series on employment and average weekly hours adjusted by data obtained from the censuses of mineral industries. Exceptions to this are the indexes of man-hours for copper mining and iron mining for 1935–1939, which were derived from accident analysis statistics of the Bureau of Mines; and the lead and zinc mining man-hours for 1935–1939, which were derived from special WPA National Research Project tabulations of Bureau of Mines data for 1935–1939. The man-hours cover only production and related workers, and exclude salaried officers, superintendents, other supervisory employees, and professional and technical employees. They include all hours worked or paid for.

W 22–29. Indexes of output per man-hour and output per employed person, 1947–1970.

Source: U.S. Bureau of Labor Statistics, *Handbook of Labor Statistics 1972*, table 85.

The measures of output per man-hour in the private economy refer to the ratio between constant-dollar gross national product (GNP) originating in the private sector of the economy or individual sectors, and the corresponding hours of all persons employed.

Two series of output per man-hour estimates have been developed. One series is based on labor force data from surveys of households, conducted by the U.S. Bureau of the Census for the Bureau of Labor Statistics. The other series, shown here, is based primarily on BLS surveys of establishments.

The output measure (GNP) used in preparing both series represents the market value (in 1958 dollars) of final goods and services produced in the economy. It includes the purchases of goods and services by consumers, business establishments, foreign investors, and the various government agencies. The GNP data are prepared by the U.S. Bureau of Economic Analysis. The establishment series is based on an hours paid concept and includes the hours of all persons on establishment payrolls in the private economy. In the development of the establishment man-hour series, data from the labor force reports and national income series were used to supplement the BLS payroll series data.

These indexes relate output to man-hours and to employment. They do not reflect the specific contributions of labor, capital, or any other factors of production. Rather, they measure the combined effect of a number of interrelated influences, such as skills of workers, managerial skills, changes in technology, capital investment per worker, utilization of capital, layout and flow of materials, and labor-management relations.

For a discussion of the BLS indexes and those prepared by the Department of Agriculture's Economic Research Service, see the text for series W 67–81.

The indexes of output per man-hour in manufacturing (series W 25) measure changes in the real value added per man-hour of all wage and salary workers, proprietors, and unpaid family workers. Annual output data used to prepare these indexes are the gross product originating in manufacturing, in 1958 dollars, developed by the U.S. Bureau of Economic Analysis. Gross product originating excludes the cost of materials and other intermediate products consumed in the production process.

Man-hours data are developed by BLS on the basis of establishment data on employment and average weekly hours and refer to hours paid.

For a complete description of the methods used, see chapter 25 of *BLS Handbook of Methods*, Bulletin 1711.

W 30. Index of output per man-hour for production workers, total manufacturing industries, 1909–1950.

Source: U.S. Bureau of Labor Statistics, 1909, 1914, and 1919–1939 computations based on *Handbook of Labor Statistics, 1947*; 1939, 1947, and 1949–1950, *Trends in Output Per Man-Hour and Man-Hours Per Unit of Output-Manufacturing, 1939–53*, Report No. 100, 1955.

The production index used to derive the index of output per man-hour in manufacturing for 1909, 1914, and the odd-numbered years 1919–1939, is from Solomon Fabricant, *Employment in Manufacturing, 1899–1939*, NBER, New York, 1942. The production index for even-numbered years to 1939 was computed by use of the Federal Reserve Index for Manufactures. The man-hours index was derived from an employment index based on U.S. Bureau of the Census and BLS data and BLS series for average weekly hours for 1909, 1919, and 1923–1939, supplemented with estimates of the WPA National Research Project for 1920–1922. For 1939, 1947, and 1949–1950, the production index was computed by BLS.

For the period before 1936, indexes of productivity are shown in *Production, Employment, and Productivity in 59 Manufacturing Industries, 1919–1936*, a 3-volume report prepared by WPA National Research Project on Reemployment Opportunities and Recent Changes in National Techniques. BLS made some revisions in these indexes and extended most of them to 1940. These measures, together with indexes of payrolls and unit labor cost, appear in the BLS report, *Productivity and Unit Labor Cost in Selected Manufacturing Industries, 1910–1940*, and were later revised. The revised output-per-man-hour series was published in the 1947 *Handbook of Labor Statistics*.

The production pattern changed radically when the United States began its World War II program. Statistics were inadequate for measuring overall changes in manufacturing efficiency during the period of transition from peace to war. Consequently, there is a gap in the measurements between 1939 and 1947.

The index of output per man-hour in manufacturing attempts to compare the labor time required in the current year to manufacture the current year's output of goods with the time required in the base year to produce the same quantity and mixture of goods. That is, it measures the change in output per man-hour, assuming that the proportion of goods produced by each industry and within each industry in each year under consideration was also produced in the base year. It is the ratio of a production index (consisting of an aggregate of quantities produced weighted by the labor time required to produce a single unit) to a man-hours index (based upon the time of production workers). The concept of physical output holds constant the relative importance of industries. Indexes developed under this concept reflect primarily the average change in productivity of plants and industries in manufacturing.

W 31–54. Indexes of output per man-hour for production workers, selected industries, 1919–1970.

Source: U.S. Bureau of Labor Statistics. For data on 1947 base, selected years, *Indexes of Output Per Man-Hour for Selected Industries: 1919–1958*, April 1959; all other years, computations (1919–1936, based on WPA National Research Project, *Production, Employment, and Productivity in 59 Manufacturing Industries*, May 1939; 1936–1939, based on BLS, *Productivity and Unit Labor Cost in Selected Manufacturing Industries, 1919–1940*, 1942; 1939–1950, based on BLS, *Productivity Trends in Selected Industries, Indexes Through 1950*, Bulletin No. 1046); for data on 1967 base, *Indexes of Output Per Man-Hour: Selected Industries, 1973 Edition*, Bulletin No. 1780.

The indexes on the 1939 base were published in 1939 by the National Research Project on Reemployment Opportunities and Recent Changes in Industrial Techniques, a unit of the Works Progress Administration. They were based on data obtained from the U.S. Bureau of the Census, BLS, and other official and private agencies. BLS made some revisions in these series, and extended most of them through 1945. These extended and revised indexes were published, together with indexes of unit labor cost, in a series of BLS publications, *Productivity and Unit Labor Cost in Selected Manufacturing Industries, 1919–1940*, and several supplements to this report. All measures in these series refer to output per production worker and are based on an aggregate of production worker man-hours.

Relative to the data on the 1967 base, the source warns that the industries covered are not necessarily a representative cross section of U.S. industry, and their output per man-hour indexes should not be combined to obtain an overall measure for the entire economy or any sector. Each index represents only the change in output per man-hour for the designated industry or combination of industries.

Output per man-hour indexes are obtained by dividing an output index by an index of aggregate man-hours. Although the measures relate output to one input—labor time—they do not measure the specific contribution of labor or any other factor of production. Rather, they reflect the joint effect of a number of interrelated influences, such as changes in technology, capital investment per worker, and capacity utilization. Industry output per man-hour measures are limited to the extent that they do not account for quality change, and often do not reflect adequately changes in the degree of plant integration and specialization. In addition, there is not always strict comparability between output and labor input estimates. Finally, year-to-year changes in output per man-hour are irregular, and therefore not necessarily indicative of basic changes in long-term trends. Conversely, long-term trends are not necessarily applicable to any one year or period in the future.

W 55–59. Indexes of output per worker in transportation, 1869–1966.

Source: John W. Kendrick, *Productivity Trends in the United States*, National Bureau of Economic Research, Princeton University Press, 1961; and *Postwar Productivity Trends in the United States*, National Bureau of Economic Research, 1973. (Copyright.)

These series represent revisions and extensions of data by Harold Barger, *The Transportation Industries, 1889–1946: A Study of Output, Employment and Productivity*, NBER, New York, 1951. In addition to extending Barger's index, Kendrick also created an index for the trucking industry which was not separately presented in the earlier study. For details concerning underlying data and computations for these series, see the sources cited.

W 55, output per worker in all transportation industries. This index measures the change in the movement of persons and property for hire per worker employed and includes the industry groupings of the national income accounts which follow closely the U.S. Office of Management and Budget, *Standard Industrial Classification Manual*.

The production index used as the numerator is based upon revenue passenger-miles and unweighted ton-miles wherever possible. Where these items were not available, less refined units were substituted, as indicated for individual industries below. Output figures were not available for industries which, in 1929, amounted to some 20 percent of the total. For these industries, output was derived from employment on the assumption that the productivity of the uncovered portion was the same as in the covered portion. The aggregate production index of the industry was derived by weighting together the group indexes using changing national income weights and applying a Marshall-Edgeworth formula.

The employment index is based upon the U.S. Bureau of Economic Analysis (BEA, formerly Office of Business Economics), employment series since 1929. For 1870–1930, the series was extrapolated by estimates of the distribution of gainfully employed workers in census years, adjusted to exclude the unemployed.

Although only output per worker is presented here, the Kendrick series afford measures of output per man-hour for total transportation and for most individual industries.

W 56, output per worker in railroads. The output of this industry includes the freight and passenger activities of Class I, II, and III line-haul roads, switching and terminal companies, the Pullman Company, and the Railway Express Agency and its predecessors.

The production index is a weighted average of simple ton-miles and revenue passenger-miles with different weights for the different classes of passenger service.

W 57, output per worker for pipelines. This index covers companies primarily engaged in the pipeline transportation of crude petroleum and refined petroleum products. Transmission of natural gas is not included. It includes trunkline mileage in interstate as well as intrastate transmission. Gathering lines are excluded.

W 58, output per worker in waterways. The productivity estimates of waterways measure the output per person employed on U.S. flag vessels in coastwise, intercoastal, Great Lakes (domestic), inland, noncontiguous, and international water transportation. The exception is that Great Lakes passenger traffic is not included.

W 59, output per worker in airlines. The productivity estimates for this industry relate to scheduled airlines and unscheduled carriers and companies primarily engaged in operating fixed facilities or providing services to airlines.

W 60–61. Indexes of output per person and per man-hour in distribution, 1869–1969.

Source: See source for series W 55–59.

These indexes represent revisions and extensions of an earlier index prepared by Harold Barger, *Distribution's Place in the American Economy Since 1869*, Princeton University Press, 1955. The original estimates by Barger represented real margin earned per man-hour on those goods reaching the public through retail stores only. The quantities sold through retail stores were weighted by average 1869 and 1929 distributive margins to derive the production aggregate. The index is thus a "net" concept, although it is more inclusive than the usual net productivity index since packaging and other supply materials customarily considered a part of margin are not eliminated.

W 62–63. Indexes of output per employee and per man-hour, 1948–1970.

Source: U.S. Bureau of Labor Statistics, *Indexes of Output Per Man-Hour: Selected Industries, 1973 Edition*, Bulletin No. 1780.

W 62, index of output per employee in air transportation, 1947–70.

Output is measured by passenger-miles and freight ton-miles for all of the certificated air carriers. Unit revenue weights are used to combine the different output services. The index series refers to output per employee (production and nonproduction workers); man-hour data are not available. Employment data are from the Civil Aeronautics Board.

W 63, index of output per employee in petroleum pipelines, 1947–69.
